About this document

This part includes the supplementary analyses for Pilot Study 1. The Pilot Study 1 materials include the registered models and hypotheses, narrative-coding reliability checks, and exploratory analyses supporting Chapter 5.

Registered Analytic Models and Hypotheses

Analytic Models.

I conducted all analyses in R (R Core Team, 2026). Each research question was tested with its own model. Chi-square tests of independence compared the content of the narratives across the four crime categories (RQ1) and across the four verdict conditions (RQ2). These tests covered the 67 automated features (i.e., the Phase 1 and Phase 2 codes), with the Benjamini–Hochberg correction applied across that family. The 14 holistic codes (i.e., the Phase 3 codes) are complete. However, all but one fell below the preregistered threshold for inter-rater reliability. I therefore used the holistic codes only in the analyses of mitigating and aggravating factors and mental states (H2a, H2b, H2c, and H3a), and I treat every result that rests on a holistic code as exploratory. I report Cramér's *V* with a 95% confidence interval for each variable.

A within-subjects one-way ANOVA tested whether post-narrative severity ratings differed across the four crime categories (RQ3, H3b). Each participant gave four ratings, one for each crime category. I applied the Greenhouse–Geisser correction when sphericity was violated. I fit the ANOVA with the afex package, computed estimated marginal means and planned contrasts with emmeans (Lenth & Piaskowski, 2017), and computed effect sizes with the effectsize package. Registered planned contrasts and main effects were tested at $\alpha = .05$ without adjustment. The one exception was the follow-up of interactions. I corrected the simple effects that probe the interaction of verdict condition and factor type (H2b) within that family. I used Tukey's HSD when the follow-up compared all pairs of estimated marginal means and the Bonferroni correction when it tested a specified subset.

Two multiple regressions tested whether scores on the Modified Abortion Attitudes Scale predicted each participant's mean severity and mean punishment ratings across the four crime categories (RQ4, H4). Age, political orientation, and religiosity were covariates. I compared the card-sort consensus with the preregistered threshold descriptively (RQ5). Mixed-effects logistic regressions tested whether the features of each scenario predicted the binary judgment that the scenario was "definitely yes, this is a crime" (H5). Each model had a random intercept for participants. I fit these models with the lme4 and lmerTest packages. A pooled McNemar's test across the 20 scenarios compared descriptive and normative crime judgments (RQ6, H6). The legal-accuracy analysis used one-sample binomial tests against chance (.50), for each scenario and pooled across scenarios. I computed the McNemar and exact binomial tests with the exact2x2 package. Two mixed-effects logistic regressions of the card-sort crime judgments tested the attitude hypotheses (RQ7, H7a and H7b). The first model pooled the two judgment types. The second added the interaction of abortion attitudes and judgment type.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Both models had crossed random intercepts for participants and scenarios, and both were fit with lme4 and lmerTest.

I report effect sizes (i.e., partial η^2, Cramér's *V*, and odds ratios) and 95% confidence intervals for all tests. The cluster analysis is exploratory. It used partitioning around medoids on Gower distance within each crime category. I fit it with the cluster package and evaluated it with the silhouette width and the gap statistic. I computed scale descriptives and reliability coefficients with the psych package. The text analyses of the narratives used quanteda (Benoit et al., 2018), with quanteda.textstats and quanteda.textplots for keyness and text statistics and udpipe for linguistic annotation. I computed inter-rater reliability (i.e., Cohen's and Fleiss's kappa) with the irr package.

The two kinds of mixed-effects logistic regression take the following multilevel form. In the feature-prediction models (H5), crime judgments i are nested within participants j. Each scenario feature F enters as a single Level-1 predictor:

$$\begin{aligned}
&\text{Level 1:} \quad \operatorname{logit}\big(\Pr(\text{crime}_{ij}=1)\big) = \beta_{0j} + \beta_1 F_{ij} \\
&\text{Level 2:} \quad \beta_{0j} = \gamma_{00} + u_{0j}, \quad u_{0j} \sim \mathcal{N}(0, \tau^2_{\text{participant}}).
\end{aligned}$$

The attitude models (H7a and H7b) cross each judgment with both participants j and scenarios k. Standardized abortion attitudes (AAS_j) enter as a participant-level (Level-2) predictor, and judgment type (descriptive vs. normative) enters as a Level-1 predictor:

$$\begin{aligned}
&\text{Level 1:} \quad \operatorname{logit}\big(\Pr(\text{crime}_{ijk}=1)\big) = \beta_{0jk} + \beta_{1jk}\,\text{JudgmentType}_{ijk} \\
&\text{Level 2:} \quad \beta_{0jk} = \gamma_{00} + \gamma_{01}\,\text{AAS}_j + u_{0j} + v_{0k} \\
&\qquad\qquad \beta_{1jk} = \gamma_{10} + \gamma_{11}\,\text{AAS}_j \\
&\qquad\qquad u_{0j} \sim \mathcal{N}(0, \tau^2_{\text{participant}}), \quad v_{0k} \sim \mathcal{N}(0, \tau^2_{\text{scenario}}).
\end{aligned}$$

H7b tests whether the association between abortion attitudes and crime judgments differs by judgment type (γ_{11}). H7a tests the main-effects model, in which $\gamma_{11} = 0$.

Hypotheses.

I grouped the seven preregistered Pilot 1 questions by the judgments participants made. RQ1 to RQ3 concerned the narratives: whether their features, mitigating and aggravating factors, and attributed mental states differed across crime categories and verdict conditions. RQ4 and RQ7 concerned abortion attitudes, measured with the Modified Abortion Attitudes Scale, as predictors of severity, punishment, and card-sort crime judgments. I predicted a stronger association with normative than descriptive judgments. The card-sort analyses (RQ5 and RQ6) tested whether at least four scenarios met the preregistered criterion for broad disagreement, whether the features of the scenarios predicted the crime judgments, and whether descriptive

© 2026 Emma Marshall · CC BY-NC-SA 4.0

and normative judgments diverged. The full hypothesis statements and analysis plan are in the preregistration on the study's OSF page.[1]

Table P1.1 lists the primary hypotheses of Pilot 1 by research question.

Table P1.1

Pilot 1 primary hypotheses by research question. The exploratory and descriptive analyses are listed in the analysis plan and are not shown here.

Hypothesis Number	*Hypothesis Title*	*Hypothesis*	*Outcome*
Hypotheses relating to narrative prototypes (RQ1)			
H1	Crime-category differences on narrative features	I predicted that the four crime categories would differ in the narrative features people wrote about, each category showing a distinct profile across the coded dimensions.	Supported
Hypotheses relating to verdict condition and narrative content (RQ2)			
H2a	Verdict Condition on Total Factor Count	I predicted that participants would write longer, more elaborated narratives under the wrongful-verdict instructions than under the rightful-verdict instructions.	Not supported
H2b	Verdict Condition × Mitigating vs. Aggravating Factors	I predicted that this wrongful-versus-rightful elaboration difference would be larger for mitigating detail than for aggravating detail.	Not supported
H2c	Mental State by Actual Culpability	I predicted that narratives whose underlying facts implied guilt would contain more purposeful or knowing intent signals than narratives whose facts implied innocence.	Not supported[a]
Hypotheses relating to mental state and severity across crime categories (RQ3)			
H3a	Mental State × Crime Category	I predicted that intent signals would vary by crime category, with self-managed-abortion narratives skewing toward purposeful or knowing intent and chemical-endangerment narratives toward reckless or negligent intent, and fetal homicide and improper disposal showing their own profiles.	Supported[a]
H3b	Crime Category on Severity	I predicted that perceived severity would differ across the four categories, with fetal	Not supported

Pilot 1 Supplementary Analyses

This section reports the checks on the narrative coding, the reliability of the holistic codes, the distributions of the ratings, the pairwise comparisons of the crime categories, and the exploratory analyses. Chapter 5 reports the main descriptive statistics, reliabilities, and results for each research question.

Validation and Reliability of the Narrative Coding

The narrative codes were assigned in three phases. In the first two phases, automated coding accepted a code when its certainty met a calibrated cutoff. Codes below the cutoff went to human coders in Phase 3. Table P1.2 shows the cutoff for each phase, and Table P1.3 shows the inter-rater reliability of the holistic Phase 3 codes. The keyness analyses in Table P1.4 and Table P1.5 serve as a convergent check on the coding. They show the words that most set each crime category apart from the others.

```r
cert_tbl ← p1_cert |>
  mutate(
    phase     = stringr::str_to_title(phase),
    cutoff    = sprintf("%.2f", cutoff),
    precision = sprintf("%.2f", precision),
    recall    = sprintf("%.2f", recall),
    f1        = sprintf("%.2f", f1)
  ) |>
  select(phase, cutoff, n_accepted, n_routed, precision, recall, f1)

cert_tbl ← cert_tbl |> dplyr::rename(
  `Phase` = phase,
  `Cutoff` = cutoff,
  `n accepted` = n_accepted,
  `n routed` = n_routed,
  `Precision` = precision,
  `Recall` = recall,
  `F1` = f1
)

dissAPA::apa_render(cert_tbl, engine = "auto", fontsize = 0.9)
```

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Table P1.2

Pilot 1 per-phase certainty-threshold calibration. The chosen cutoff per phase maximized F1 subject to a recall floor of .80, calibrated on a hand-coded 100- to 200-narrative sub-sample. Codes at or above the cutoff are accepted automatically; codes below are routed to Phase 3 for human review.

Phase	Cutoff	n accepted	n routed	Precision	Recall	F1
Phase1	0.00	2190	0	0.58	0.59	0.58
Phase2	0.30	767	0	0.88	0.68	0.77

```r
irr_p3_tbl ← p1_irr_phase3 |>
  mutate(
    ni     = !is.na(not_interpretable) & not_interpretable,
    label  = ifelse(ni, paste0(label, "†"), label),
    stat   = ifelse(statistic == "ICC", "ICC", "κ"),
    est    = ifelse(is.na(estimate), "—",

Table P1.3

Pilot 1 Phase 3 holistic-coding inter-rater reliability on the double-coded subsample. Cohen's kappa is reported for binary codes and the intraclass correlation for ordinal and dimensional codes, each with its 95% confidence interval and the number of double-coded narratives on which it was computed. Five codes are scored as ordinal rather than categorical because their values carry an order; for those codes the registered unweighted kappa is reported alongside the ICC, and the not-specified value is excluded from both. The preregistered target is kappa >= .75 (binary) or ICC >= .80 (ordinal/dimensional). Media framing was invariant across the subsample, so no coefficient is defined. † Too few narratives specified the construct for both coders to score it; these estimates are reported for completeness and are not reliability evidence in either direction.

Holistic code	Statistic	Estimate	95% CI	Registered κ	n	Target	Met
Socioeconomic status†	ICC	.62	[−.41, .94]	.25	6	.80	—
Defendant sympathy (1-5)	ICC	.58	[.37, .73]	—	57	.80	No
Pregnancy wantedness	ICC	.55	[.21, .77]	.25	25	.80	No
Mens rea category	ICC	.67	[.50, .80]	.43	55	.80	No
Partner role framing†	ICC	.96	[.85, .99]	.84	9	.80	—
Healthcare-provider role framing†	ICC	.57	[−.09, .88]	.23	10	.80	—
Other-actor culpability	κ	.56	[.18, .85]	—	57	.75	No
Mitigating character framing	κ	.14	[.00, .41]	—	57	.75	No
Mitigating fetal-value framing	κ	.24	[−.08, .68]	—	57	.75	No
Aggravating callousness framing	κ	.79	[.50, 1.00]	—	57	.75	Yes
Evidentiary balance (1-3)	ICC	.28	[.03, .50]	—	56	.80	No
Factual ambiguity	κ	.22	[−.08, .52]	—	57	.75	No
Verdict consistency (1-3)	ICC	.37	[.10, .59]	—	46	.80	No
Media framing present	κ	—	—	—	57	.75	—

Rating Distributions by Crime Category

The figure below shows the distributions of the post-narrative severity, guilt, and punishment ratings by crime category. Chapter 5 of the dissertation refers to this figure.

```r
# One row per participant, crime category and rating (columns crime, rating, value), the chapter's data file. Drawn as
# the chapter drew it (dissAPA::geom_ridges_apa(), one facet per rating, the 1-7 scale), in colour, as the chapter first drew it.
p1_ratings_long <- read_p1("pilot01_ratings_long.csv")
if (is.null(p1_ratings_long)) {
  knitr::asis_output("The rating distributions render once pilot01_ratings_long.csv has been exported.")
} else {
  p1_rat <- as.data.frame(p1_ratings_long)
  p1_rat$crime  <- factor(p1_rat$crime, levels = c("Self-managed abortion", "Fetal homicide", "Chemical endangerment", "Improper disposal"))
  p1_rat$rating <- factor(p1_rat$rating, levels = c("Severity", "Guilt", "Punishment"))

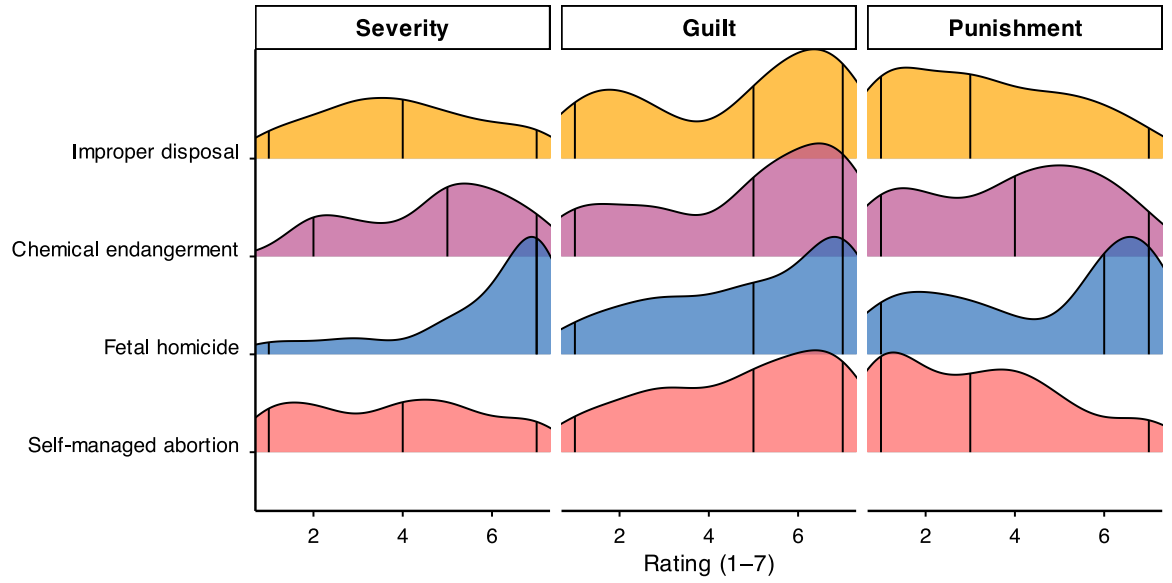
Figure P1.1

Pilot 1 distributions of post-narrative severity, perceived guilt, and recommended punishment ratings (1–7) by crime category. Lines mark the 2.5th, 50th, and 97.5th percentiles.



Crime-Category Pairwise Comparisons

I followed up the H3b within-subjects ANOVA with pairwise comparisons of mean severity across the four crime categories. The comparisons used Fisher's least significant difference procedure (Levin et al., 1994). With four groups that procedure does not hold the familywise error rate at .05, so Table P1.6 also shows Tukey-adjusted *p* values.

```r
if (is.null(p1_rh32_pairs)) {
  stop("rq3_rh32_pairwise.csv is missing: render analysis/
pilot01/06_rq3_severity.qmd first.",
       call. = FALSE)
}
rh32_omni <- dplyr::distinct(p1_rh32_pairs, omnibus_F, omnibus_df1, omnibus_df2,
omnibus_p)
stopifnot(
  "rq3_rh32_pairwise.csv: expected six pairs sharing one omnibus test" =
    nrow(p1_rh32_pairs) == 6L && nrow(rh32_omni) == 1L
)

rh32_fmt_df <- function(x) {
  ifelse(abs(x - round(x)) < 1e-8, sprintf("%.0f", x), sprintf("%.2f", x))
```

```
)

dissAPA::apa_render(rh32_pairs_tbl, engine = "auto", note = rh32_pairs_note,
fontsize = 0.9)
```

Table P1.6

Pilot 1 pairwise comparisons of mean severity ratings (1–7) across the four crime categories, from the H3b within-subjects ANOVA. Difference is the first category's estimated marginal mean minus the second's.

Comparison	Difference	t(80)	p	Significant (LSD)	p (Tukey)
Self-managed abortion – Fetal homicide	−1.98	−8.40	< .001	Yes	< .001
Self-managed abortion – Chemical endangerment	−0.88	−3.77	< .001	Yes	.002
Self-managed abortion – Improper disposal	−0.14	−0.62	.536	No	.925
Fetal homicide – Chemical endangerment	1.10	6.00	< .001	Yes	< .001
Fetal homicide – Improper disposal	1.84	7.57	< .001	Yes	< .001
Chemical endangerment – Improper disposal	0.74	3.35	.001	Yes	.007

Note. Following a significant omnibus test of crime category (F(2.75, 220.01) = 32.90, p < .001, Greenhouse–Geisser corrected), the comparisons used Fisher's least significant difference (LSD) procedure: a pair is significant when its own, unadjusted p is below .05. Because with four categories that procedure does not hold the familywise error rate at .05, Tukey-adjusted p values are shown beside it (Levin et al., 1994).

Exploratory and Legal-Accuracy Analyses

The tables below report the exploratory regressions and the accuracy of participants' legal judgments for each scenario. I describe the legal-accuracy results in the next chapter of this part.

                          estimate = "β"),
  engine = "auto", note = exp2_note
)
```

Table P1.8

Pilot 1 exploratory multiple regressions predicting participant-level mean severity, guilt, and punishment from benevolent sexism, hostile sexism, and religiosity, entered as simultaneous standardized predictors.

outcome	Predictor	β	95% CI	t	p
Severity	Benevolent sexism	0.01	[−0.23, 0.25]	0.09	.926
Severity	Hostile sexism	0.03	[−0.21, 0.26]	0.23	.815
Severity	Religiosity	0.35	[0.14, 0.57]	3.23	.002
Guilt	Benevolent sexism	0.03	[−0.23, 0.28]	0.21	.838
Guilt	Hostile sexism	−0.05	[−0.30, 0.20]	−0.43	.668
Guilt	Religiosity	0.07	[−0.17, 0.30]	0.56	.577
Punishment	Benevolent sexism	−0.03	[−0.28, 0.22]	−0.21	.831
Punishment	Hostile sexism	0.19	[−0.06, 0.43]	1.53	.131
Punishment	Religiosity	0.16	[−0.07, 0.38]	1.36	.177

Note. β = standardized regression coefficient from a multiple regression of the participant-level mean rating on benevolent sexism, hostile sexism, and religiosity (entered simultaneously); 95% CI = Wald interval; t-tests use 77 residual df.

Table P1.9

Pilot 1 per-scenario lay legal accuracy. Accuracy is the proportion of participants whose descriptive "is this a crime where you live" judgment matched the coded legal status of the scenario in the participant's state of residence, with one-sample binomial 95% confidence intervals. State-variant scenarios carry between-state differences in legal status; state-invariant scenarios are constant across all 51 jurisdictions.

Scenario	n	n correct	Accuracy	95% CI	Scenario type
1	81	62	.77	[.66, .85]	Abortion (state-variant)
2	81	63	.78	[.67, .86]	Abortion (state-variant)
3	80	66	.82	[.72, .90]	Abortion (state-variant)

Verdicts, Mental State and Legal Accuracy

This chapter reports the analyses of the narratives by verdict condition (RQ2, H2a, H2b, and H2c) and three exploratory analyses. These are the accuracy of participants' legal judgments, the three-way interaction of abortion attitudes, state law, and judgment type, and the comparison of the narratives with television plotlines and documented cases.

Narrative Features by Verdict Condition (RQ2)

A series of descriptive chi-square tests compared the frequency of each feature across the four verdict conditions, with the Benjamini–Hochberg correction applied across the testable features (RQ2; see Table P1.10). After the correction, 12 features varied with the verdict participants were instructed to write toward, including legal terminology ($\chi^2(3, N = 311) = 28.98$, BH-adjusted $p < .001$) and causal structure ($V = .29$).

```r

witness	311	14.58	3	.19*	[.03, 1.00]	.016
juryreason	311	14.10	3	.19*	[.00, 1.00]	.018

Note. Chi-square tests of independence between verdict condition (4 levels) and each narrative feature. n = number of narratives with the feature coded; Cramer's V is reported with its 95% CI. p (BH) = p-value Benjamini-Hochberg-adjusted across the 65 testable Phase 1/2 features; the table lists the 10 features with the smallest adjusted p values. Asterisks denote BH-adjusted significance: * p < .05. ** p < .01. *** p < .001.

Coded Factors by Verdict Condition (H2a and H2b)

H2a predicted that narratives written toward a wrongful verdict would contain more coded mitigating and aggravating factors than narratives written toward a rightful verdict. There was no significant difference in total coded factors per narrative across the four verdict conditions, $F(3, 76) = 0.88$, $MSe = 0.33$, $p = .456$, $\eta^2 = .034$. Contrary to H2a, narratives in the wrongful conditions ($M = 1.00$, $SD = 0.56$) did not contain significantly more coded factors than narratives in the rightful conditions ($M = 0.80$, $SD = 0.57$; see Figure P1.2).

© 2026 Emma Marshall · CC BY-NC-SA 4.0

H2b predicted that the wrongful–rightful difference would be larger for mitigating than for aggravating factors. There was no significant interaction between verdict condition and factor type, $F(3, 76) = 0.59$, $MSe = 0.13$, $p = .622$, $\eta_p^2 = .023$. Contrary to H2b, the wrongful–rightful difference was not larger for mitigating factors. However, there was a significant main effect of factor type: narratives contained more mitigating factors ($M = 0.50$, $SD = 0.37$) than aggravating factors ($M = 0.39$, $SD = 0.39$; $F(1, 76) = 4.54$, $MSe = 0.13$, $p = .036$, $\eta_p^2 = .056$).

Mental State by Actual Culpability (H2c)

H2c rests on the coded mental-state category, so I report it as exploratory. H2c predicted that narratives in the culpable conditions would attribute purposeful or knowing mental states more often than narratives in the non-culpable conditions. The relationship between actual culpability and coded mental state was not significant, $\chi^2(1, N = 279) = 0.32$, $p = .572$. Contrary to H2c, coded mental state did not differ by actual culpability. However, the mental-state code did not meet the preregistered reliability target (ICC = .67, registered $\kappa = .43$, target = .80; see Table P1.3), leaving this result inconclusive. The code was not reliable enough to tell whether participants matched the mental state to the verdict they wrote toward or to the facts of the case.

Legal Accuracy of the Crime Judgments

State-law coding. For the legal-accuracy sub-analysis, participants' descriptive judgments ("Is this a crime where you live?") were compared with the legal status of each scenario in their state of residence as of May 2026. Participant responses were matched based on accuracy (yes/no). However, given that the specifics of state laws regarding abortion remain in flux and convoluted, I did not interpret a mismatch as true ignorance of the underlying state-specific status. For example, many state abortion bans do not apply to pregnant people as a matter of black letter law, but they still can be, and have been, used to criminalize abortion (Weigel et al., 2020), so whether self-managed abortion is a crime in a given state is not a clear binary. Appendix A of the dissertation gives the coding rules and sources for each state and the confidence flags used in the preregistered sensitivity analysis.

I report the legal-accuracy analysis as exploratory. Compared with the state-law coding, accuracy differed significantly from chance on 19 of the 20 scenarios. Accuracy on the nine state-invariant scenarios ranged from .95 to 1.00 ($M = .98$) and was lower on the six abortion scenarios with between-state variance (.64 to .82, $M = .76$). The per-scenario accuracy tallies appear in Table P1.9.

Abortion Attitudes, State Law, and Judgment Type

I report this analysis as exploratory. When the state-law coding was added to the mixed-effects model of card-sort crime judgments, the three-way Attitudes × State Law × Judgment

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Type interaction was significant (OR = 0.28, 95% CI [0.13, 0.63], $z = -3.09$, $p = .002$; see Table P1.7). Because Pilot 1 was not powered to detect three-way interactions ($N = 81$), I report this estimate descriptively.

Narratives Compared With Television Plotlines and Documented Cases

I report these comparisons as exploratory and descriptive. None was tested inferentially. As registered, I compared the abortion methods named in the narratives (i.e., the Section F method code) with the methods shown in U.S. television abortion plotlines (Herold & Sisson, 2019). I mapped the television categories onto the method code (see Table P1.11). The largest difference was for physical or instrument methods. They were named in .42 of the narratives that specified a method and in .67 of the procedures in the television plotlines.

The Section J code identified narratives referring to real-world cases. None of the 311 narratives referred to a documented real-world case. For the prosecution comparison, I used documented U.S. pregnancy-criminalization cases (Pregnancy Justice, 2023) in place of the registered television reference, which contains no account of actual prosecutions. I recorded this source change as a deviation. I prompted approximately .25 of the narratives for each crime category; these shares reflect the design rather than participants' expectations. In documented prosecutions, charges for chemical endangerment (i.e., criminal child neglect, abuse, or endangerment) made up .84 of charged cases. Fetal homicide made up .06, improper disposal .03, and self-managed abortion .01. The balanced design therefore over-samples the three categories that are rare in actual prosecutions.

About this document

This part includes the full analyses for Pilot Study 2. Chapter 5 of the dissertation reports the hypotheses and main results. Here I report the analytic framework and hypotheses, the full results with their tables and figures, and the supplementary, exploratory, and robustness analyses.

The last chapter of this part (Simulation and Planning Outputs) includes simulation and planning outputs from before I analyzed the Pilot 2 data. I used the simulated estimates to plan the analyses; they do not describe the responses of Pilot 2 participants.

Analytic Framework and Hypotheses

Analytic Framework.

I conducted all analyses in R (R Core Team, 2026). I estimated the hindsight effects with Bayesian multilevel models fit with the brms package (Bürkner, 2017, 2018) through the cmdstanr interface to Stan. Each participant received one kind of search outcome across the three vignettes and rated each vignette before and after learning its outcome. I accounted for these repeated ratings in the expected-versus-unexpected evidence comparison. I used non-criminal miscarriage as the reference case. I computed planned contrasts and average comparisons with marginaleffects (Arel-Bundock et al., 2024). I tested the mediation hypotheses with their indirect effects, which I summarized from the posterior draws with the posterior and bayestestR packages (Falk et al., 2023; Makowski et al., 2019; Miočević et al., 2018; Vuorre & Bolger, 2018). I based each conclusion on whether the 95% credible interval excluded zero (Kruschke & Liddell, 2018).

The preregistration allowed frequentist mixed factorial ANOVAs of the continuous outcomes. The analysis plan also included a GEE check of search-target endorsement. I evaluated the registered hypotheses with the Bayesian decision rules. This supplement reports the Bayesian results.

The multilevel models take the following form. Y is a continuous outcome measured on occasion t (i.e., before or after the outcome, or the vignette) within participant j. The kind of incriminating evidence found, $\mathrm{Outcome}_j$, varies between participants:

$$
\begin{aligned}
\text{Level 1:} \quad & Y_{tj} = \pi_{0j} + \pi_{1j} W_{tj} + e_{tj}, \quad e_{tj} \sim \mathcal{N}(0, \sigma^2) \\
\text{Level 2:} \quad & \pi_{0j} = \gamma_{00} + \gamma_{01} \,\mathrm{Outcome}_j + u_{0j} \\
& \pi_{1j} = \gamma_{10} + \gamma_{11} \,\mathrm{Outcome}_j + u_{1j} \\
& (u_{0j}, u_{1j})^\top \sim \mathcal{N}(\mathbf{0}, \mathbf{T}).
\end{aligned}
$$

Here W_{tj} is the within-participant factor (i.e., before or after the outcome, or the vignette). The within-participant change is represented by γ_{10}, with γ_{11} representing how that change depends on the kind of evidence found. Participant intercepts and slopes have covariance matrix $\mathbf{T}$. For binary search-target endorsement, I retained the Level-2 structure and modeled $\mathrm{logit}\left(\Pr(Y_{tj} = 1)\right)$ in place of Y_{tj}, without a Level-1 residual term.

I used mean-zero Normal priors for the regression coefficients, with widths matched to the outcome scales to provide weak regularization. The log-odds coefficients of the binary-choice models had a similarly weak prior (Bürkner, 2018; Gelman et al., 2008; Gelman et al., 2014; Hox et al., 2018; Sorensen et al., 2016). I used an LKJ(2) prior for correlations among partic-

© 2026 Emma Marshall · CC BY-NC-SA 4.0

ipant random effects and retained the scale-aware Student-*t* defaults in brms for intercepts, random-effect standard deviations, and residual standard deviations (Bürkner, 2017, 2018). For the H5a sensitivity check, I refit the model with half and twice the coefficient-prior widths (Depaoli et al., 2020; Hox et al., 2018). Appendix G of the dissertation records the priors and sampler settings.

Hypotheses.

The Pilot 2 registration covers hindsight, evidence reinterpretation, decision quality, judgments of the suspect, attitudes, and search targets. I use the registered identifiers (e.g., RH2.1 and E5.1) when reporting these analyses and state the applicable decision rules. Table P2.1 pairs the confirmatory hypotheses with their Chapter 5 labels.[2]

```r
# Built from the project hypothesis tracker (confirmatory rows only), so every
# statement is the canonical `RH (revised)` text verbatim. See the setup chunk
# for the hypothesis-table renderer (now dissAPA::apa_hypotheses()).
#

Table P2.1

Pilot 2 confirmatory hypotheses, grouped under the hypothesis labels in Chapter 5. The statements paraphrase the registration, which gives the exact wording and decision rules.

Hypothesis Number	*Hypothesis Title*	*Hypothesis*
H1a. The pre-search likelihood of the four possible search outcomes		
RH6.1	vignette differences in the pre-search likelihood of the candidate search outcomes [RQ1]	I predicted that the three vignettes would differ in the pre-search likelihood participants assigned to the four candidate search outcomes.
H2a. Subjective probability of guilt		
RH1.1	Pre–post shift in probable-cause strength [RQ2]	I predicted that, within each participant, the rated strength of probable cause would be higher after the search outcome was revealed than before, even though they were told to set the outcome aside.
RH2.1	HACE versus HUCE hindsight shift [RQ2]	I predicted that this hindsight shift in probable cause would be larger when the recovered evidence matched the warrant's pregnancy theory (an expected outcome) than when it did not (an unexpected outcome).
H2b. Perceived foreseeability of the revealed outcome		
RH1.3	Pre–post increase in foreseeability [RQ2]	I predicted that participants would judge the outcome more foreseeable after it was revealed than before.
H2c. Estimated likelihood of the revealed outcome		
RH1.2	Outcome-knowledge allocation shift [RQ2]	I predicted that each participant's allocation of likelihood across the possible outcomes would shift toward whatever the search actually recovered.
RH2.2	Vignette-moderated allocation shift [RQ2]	I predicted that the shift toward pregnancy-specific likelihood would depend on the vignette in the pattern Causal Model Theory predicts, largest where the case gave the outcome the best causal fit.
H2d. Rated likelihood on the financial-crime item		
RH2.3	Financial-crime filler-item shift [RQ2]	I predicted that the financial-crime

Full Analyses

Baseline Expectations

Participants rated pregnancy-evidence likelihood before learning what the search found. I compared their later ratings with their own pre-search ratings.

Pregnancy-Evidence Likelihood and Guilt

I examined changes after expected incriminating evidence in ratings of illegally obtained abortion (Item 1) and improper disposal or concealment of the loss (Item 2). Table P2.2 reports the six before-to-after contrasts and comparisons of outcome specificity. In the self-managed abortion case, participants increased the Item 1 rating (b = 16.74, 95% credible interval [11.83, 21.49], $p(b > 0) > .999$). The increase was greater for Item 1 than Item 2 (b = 18.65, 95% credible interval [12.08, 25.67], $p(b > 0) > .999$), consistent with the outcome specificity described by Yopchick & Kim (2012).

```r
# Keep the two families and their signed probabilities explicit.
p2_rq1_input <- bind_rows(
  p2_a1 |> mutate(contrast = paste0("Before-to-after — ", contrast)),
  p2_a2 |> mutate(contrast = paste0("Specificity — ", contrast))
)

dissAPA::apa_render(supp_bayes_table(p2_rq1_input), engine = "auto")
```

Table P2.2

*Pilot 2 RQ1 primary contrasts on likelihood items. The before-to-after contrasts test the expected-outcome before-to-after shift on the pregnancy-specific composite (Item 1 + Item 2). The specificity contrasts test whether the shift is specific to Items 1 and 2 versus the financial-crime filler (Item 3). All sub-hypotheses other than the case-ordering diagnostic are primary. * 95% CrI excludes zero.*

Quantity	Estimate	95% HDI	Pr(effect > 0)
Before-to-after — RH2.2 expected outcome before-to-after · self-managed-abortion case — SMA item	16.740*	[11.830, 21.490]	> .999
Before-to-after — RH2.2 expected outcome before-to-after · self-managed-abortion case — Disposal item	−1.920	[−6.760, 2.960]	.216
Before-to-after — RH2.2 expected outcome before-to-after · ordinary-miscarriage case — SMA item	23.210*	[18.490, 27.970]	> .999
Before-to-after — RH2.2 expected outcome before-to-after · ordinary-miscarriage case — Disposal item	0.280	[−4.570, 4.850]	.547
Before-to-after — RH2.2 expected outcome before-to-after · criminal-miscarriage case — SMA item	13.430*	[8.530, 18.190]	> .999
Before-to-after — RH2.2 expected outcome before-to-after · criminal-miscarriage case — Disposal item	−0.810	[−5.750, 3.920]	.371
Specificity — RH2.3 timing x outcome on the Financial item, VIGNETTE-AVERAGED (registered criterion)	22.750*	[18.890, 26.580]	> .999
Specificity — RH2.3 sub-condition: HUCE pre->post increase on the Financial item, vignette-averaged (credibly positive required)	22.080*	[19.420, 24.890]	> .999
Specificity — RH2.3 sub-condition: HACE pre->post change on the Financial item, vignette-averaged (near zero required)	−0.670	[−3.480, 2.090]	.321
Specificity — descriptive: same contrast @ SMA	21.710*	[15.130, 27.900]	> .999
Specificity — descriptive: same contrast @ NCM	21.590*	[15.890, 27.470]	> .999
Specificity — descriptive: same contrast @ CM	24.980*	[18.650, 31.480]	> .999

Subjective probability of guilt. I also compared participants' guilt-probability ratings before and after the search outcome (Table P2.3). The table includes the main effect on foreseeability,

© 2026 Emma Marshall · CC BY-NC-SA 4.0

and Figure P2.1 connects the mean guilt-probability ratings before and after the outcome for each vignette and outcome condition.

```r
# Prefix each family and retain Pr(effect > 0), without relabelling it pd.
p2_rq3_input ← bind_rows(
  p2_slider |> mutate(contrast = paste0("Rating, before/after — ", contrast)),
  p2_p3     |> mutate(contrast = paste0("Foreseeability — ", contrast))
)
dissAPA::apa_render(supp_bayes_table(p2_rq3_input), engine = "auto")
```

Table P2.3

*Pilot 2 RQ1 before/after subjective-probability-of-guilt rating and foreseeability contrasts. Rating rows report within-participant before-to-after shifts; the foreseeability row reports the within-participant before-to-after main effect on the foreseeability composite. * 95% CrI excludes zero.*

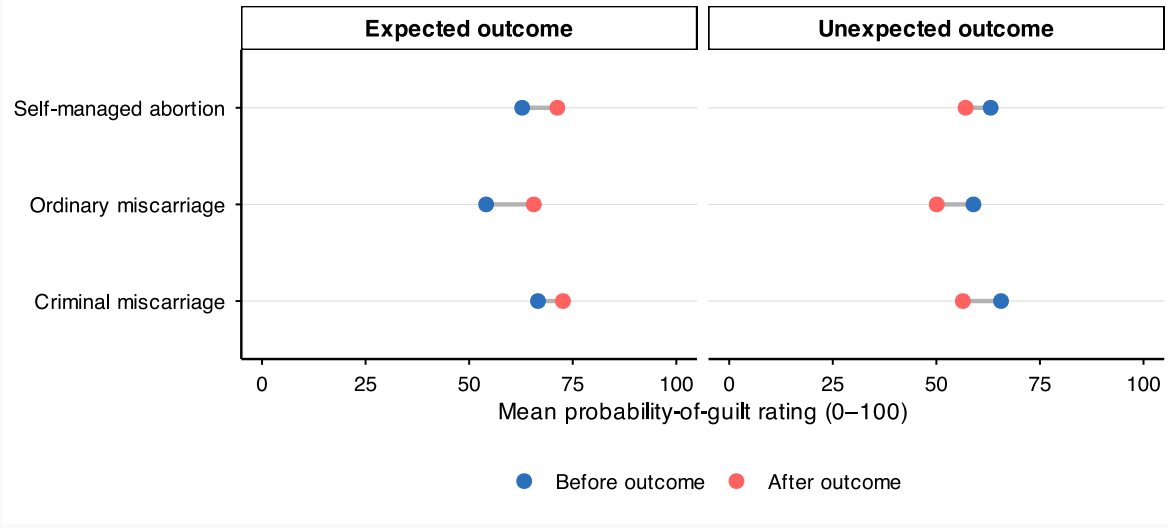
Quantity	Estimate	95% HDI	Pr(effect > 0)
Rating, before/after — RH1.1 rating Timing main effect (post - pre), vignette-averaged	0.308	[−1.738, 2.238]	.618
Rating, before/after — RH2.1 rating timing x outcome (expected outcome > unexpected outcome), vignette-averaged	16.488*	[12.597, 20.467]	> .999
Foreseeability — RH1.3 foreseeability Timing main effect (post - pre, pooled; no committed direction)	−0.138*	[−0.202, −0.076]	< .001

```r
dissAPA::geom_dumbbell_apa(
  as.data.frame(p2_prepost),
  foresight = "before", hindsight = "after",
  group = "vignette", facet_by = "outcome",
  labels = c("Before outcome", "After outcome"),
  x_lab = "Mean probability-of-guilt rating (0–100)"
) +
  ggplot2::coord_cartesian(xlim = c(0, 100))
```

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Figure P2.1

Pilot 2 before-to-after shift in the subjective probability-of-guilt rating (0–100): each vignette's mean rating before the outcome connected to its mean rating after, faceted by the revealed outcome (expected vs. unexpected).



Evidence reinterpretation (RQ3). The primary result for evidence reinterpretation uses the measurement model selected in Table P2.8. Table P2.13 reports the same indirect effect with the observed composite (RH3.1) and the indirect effects for each vignette (E3.1). Those results are secondary. They did not determine which measurement model was primary.

Pregnancy-Specific Likelihood and Foreseeability Across the Cases.

Following Nestler & Egloff (2009), I adapted the distinction between hindsight components to the cases in this study (see Chapter 4). If foreseeability and pregnancy-specific likelihood reflect different mechanisms, the largest increases should occur in different cases, producing opposite orderings across cases rather than opposite changes within a case. The gain in likelihood should be largest in the criminal miscarriage case, where the outcome is easiest to reconcile with the facts. The gain in foreseeability should be largest in the self-managed abortion case, where the outcome is least surprising. The test is therefore the difference between the self-managed abortion and criminal miscarriage cases. I predicted that this difference would be positive for foreseeability and negative for the likelihood. Table P2.4 reports the before-to-after changes in each component for each case.

```r
p2_rq2_tbl ← p2_a6 |>
  mutate(
```

© 2026 Emma Marshall · CC BY-NC-SA 4.0

```
    p_preg = zr_fmt(p_preg_est, 2),
    fore   = zr_fmt(fore_est, 2),
    pp     = vapply(prob_opposite_sign, fmt_pp, character(1))
  ) |>
  select(vignette_contrast, p_preg, fore, pp)

names(p2_rq2_tbl) ← c("Case contrast", "pregnancy-specific likelihood shift",
                      "foreseeability shift", "P(opposite-signed)")
dissAPA::apa_render(p2_rq2_tbl, engine = "auto", fontsize = 0.9)
```

Table P2.4

Pilot 2 RQ1 component dissociation: per-case likelihood vs. foreseeability expected-outcome before-to-after shifts and the posterior probability that the two shifts carry opposite signs.

Case contrast	pregnancy-specific likelihood shift	foreseeability shift	P(opposite-signed)
Self-managed abortion vs. criminal miscarriage	0.03	−0.03	.175

A related test asked whether the change after expected evidence was larger for pregnancy-specific foreseeability than for general foreseeability. Table P2.14 reports the change in each measure and the difference between them.

Evaluations of the Detective's Decision.

The analyses in Table P2.5 are exploratory. I expected ratings of the quality of the detective's decision to fall from before to after the outcome under both expected and unexpected evidence (i.e., a before-to-after main effect). I did not expect the two kinds of evidence to differ on the composite. The exploratory analyses split the change into a hindsight route (i.e., through evidence reinterpretation) and an outcome-bias route (i.e., through the preference for false-positive or false-negative errors). Table P2.5 reports the contrasts and both routes.

```
p2_rq6_tbl ← bind_rows(
  p2_b6  |> mutate(family = "Decision-quality contrasts (Exploratory)", label =
contrast) |>
            select(family, label, estimate, hdi_low, hdi_high, p_gt_0),
  p2_b6c |> mutate(family = "Indirect decomposition (Exploratory)", label =
route) |>
            select(family, label, estimate, hdi_low, hdi_high, p_gt_0)
) |>
  mutate(
    est = paste0(zr_fmt(estimate, 2),
```

© 2026 Emma Marshall · CC BY-NC-SA 4.0

```
                ifelse(!is.na(hdi_low) & !is.na(hdi_high) &
                       ((hdi_low > 0 & hdi_high > 0) | (hdi_low < 0 & hdi_high <
0)),
                       "*", "")),
    ci  = mapply(fmt_ci, hdi_low, hdi_high),
    pp  = vapply(p_gt_0, fmt_pp, character(1))
  ) |>
  select(family, label, est, ci, pp)

# The `family` column (formerly merge_v) becomes full-width section bands via
# group_col, the both-engine replacement for the flextable vertical merge.
p2_rq6_tbl <- p2_rq6_tbl |>
  rename(`Contrast / route` = label, Estimate = est, `95% CrI` = ci, `P(b > 0)` =
pp)
dissAPA::apa_render(p2_rq6_tbl, engine = "auto", fontsize = 0.9, group_col =
"family")
```

Table P2.5

*Pilot 2 RQ2 decision-quality contrasts and indirect-path decomposition (both exploratory). * 95% CrI excludes zero.*

Contrast / route	Estimate	95% CrI	P(b > 0)
Decision-quality contrasts (Exploratory)			
RH4.1 decision-quality Timing main effect (post - pre; registered direction positive), vignette-averaged	0.17*	[0.09, 0.25]	> .999
RH4.2 timing x outcome (expected outcome > unexpected outcome), vignette-averaged	0.27*	[0.12, 0.42]	> .999
Indirect decomposition (Exploratory)			
hindsight route (a_s * b_s)	0.14*	[0.09, 0.19]	> .999
direct outcome-bias route (a_sigma * b_sigma)	0.04*	[0.003, 0.07]	.988
index of moderated mediation (a_sigma * mod)	−0.001	[−0.03, 0.02]	.430

Three more tables report related results. Table P2.15 reports E4.1 with specific foreseeability in place of the subjective probability of guilt. Table P2.16 reports the E4.3 indirect effects for each vignette and two relative indices. For RH4.1, I expected participants to evaluate the detective's decision more favorably after learning the search outcome. The descriptive before-to-after coefficient for RH4.1 appears in Table P2.17; I used the change in subjective probability of guilt as E4.1's primary mediator. The negative exploratory expectation above was separate from RH4.1.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Judgments of the Detective.

These analyses are exploratory. E6.1 tested the effects of the search outcome on the detective's blameworthiness, the consequences the detective deserved, and the wrongness of the decision. E6.4 tested a path from outcome-specific foreseeability through the detective's blameworthiness to the consequences the detective deserved. I expected this indirect effect to be negative. Table P2.20 also reports the direct effect of the outcome at each level of error preference and the difference between them.

Model of Suspect Blame Through Likelihood and Negligence.

For H5a, I estimated the indirect effect of expected versus unexpected incriminating evidence on suspect blame through pregnancy-specific likelihood and then negligence. The product of the three path coefficients was the primary indirect effect (Table P2.6; posterior median = 0.220, 95% credible interval [−0.030, 0.503], p(indirect > 0) = .962). That table also gives the extension with likelihood, foreseeability, negligence, and recklessness as parallel mediators. I report the remaining direct effects on blame and punishment in Table P2.7, the fitted chain in Figure P2.3, and the indirect-effect intervals in Figure P2.2.

```r
# Confirmatory serial and exploratory four-mediator quantities, with signed
probabilities.
p2_rq4_input ← bind_rows(
  p2_c4  |> mutate(label = paste0("Primary serial — ", contrast)),
  p2_c4c |> mutate(label = paste0("Exploratory four-mediator — ", mediator))
) |>
  select(label, estimate, hdi_low, hdi_high, p_gt_0)
dissAPA::apa_render(supp_bayes_table(p2_rq4_input, "label"), engine = "auto")
```

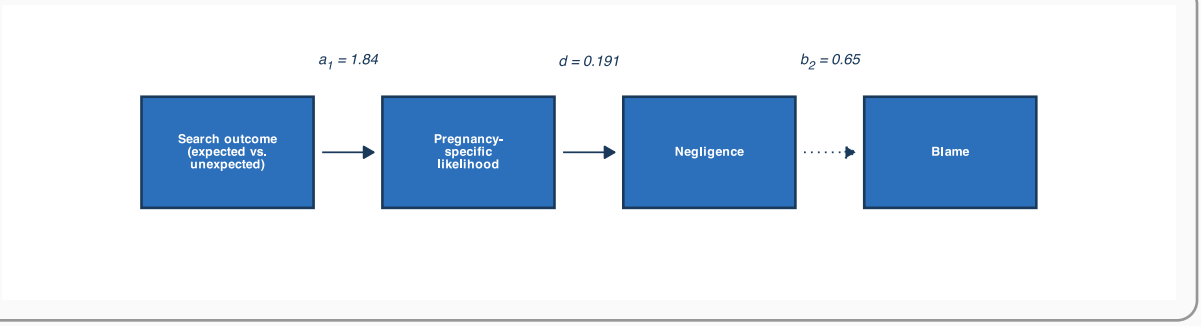
Figure P2.3

Pilot 2 RQ3 primary serial chain (between-person, fitted): the kind of incriminating evidence found (expected vs. unexpected outcome) → pregnancy-specific likelihood → negligence → suspect blame. Each arrow is annotated with the posterior median of the corresponding path coefficient; solid arrows mark paths whose 95% HDI excludes zero, dotted arrows mark paths whose HDI includes zero.



I compared the likelihood–negligence and foreseeability–negligence routes from outcome information to blame (E5.1). Table P2.12 reports the two indirect-effect products, their difference, and the direct effect. Adding relevance before likelihood gave the longer relevance–likelihood–negligence route to blame in E5.7, for which I obtained a bias-corrected bootstrap interval (Table P2.18).

Attitudes as moderators and mediators (exploratory). I examined whether abortion attitudes moderated the outcome differences in pregnancy-specific likelihood and foreseeability (E5.4), comparing estimates at 1 *SD* below and above the attitude mean. E5.6 concerned the indirect associations of the sexism subscales with punishment through support for punishment and abortion attitudes (Table P2.19).

Evidence Reinterpretation and Search Targets

The search-target pathway was discontinued on September 7, 2026.

I describe the change in relevance using the composite in Table P2.25 and individual items within each vignette in Table P2.26. The item comparisons have unadjusted *p* values. The registered RH1.4 analysis separately tests the interaction between timing and item consistency (see Evidence Reinterpretation (RQ3)).

```r
dissAPA::geom_dumbbell_apa(
  as.data.frame(p2_eg_prepost),
  foresight = "before", hindsight = "after",
  group = "item", facet_by = "outcome",
  labels = c("Before outcome", "After outcome"),
```

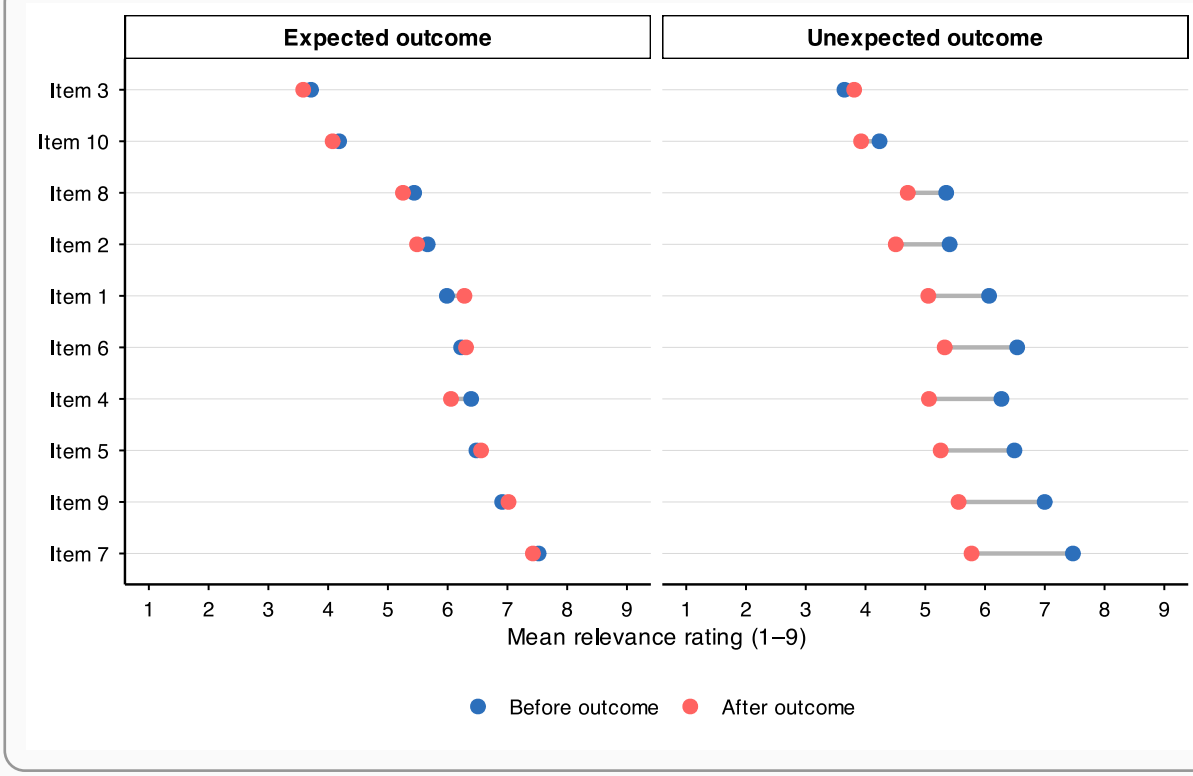
```
  x_lab = "Mean relevance rating (1–9)"
) +
  ggplot2::coord_cartesian(xlim = c(1, 9)) +   # full 1–9 relevance scale (PI
2026-09-28: full axes on every figure)
  ggplot2::scale_x_continuous(breaks = 1:9)
```

Figure P2.4

Pilot 2 foresight-to-hindsight shift in evidence relevance: each affidavit evidence item's mean relevance rating (1–9) before the outcome connected to its rating after, faceted by the revealed outcome (expected vs. unexpected).



Search Endorsement

Participants' certainty requirements and the endorsement thresholds are different quantities. The thresholds concern the subjective probability of guilt at which the model predicts a .50 probability of approving a search. The observed endorsement proportions appear in Table P2.21.

For E7.7, Table P2.22 gives the model-derived thresholds for the sample as a whole and the share of posterior draws with a threshold inside the guilt-probability scale. I treated differences in the ordering of search targets as descriptive; I did not test that ordering.

Mens-Rea Attributions by Search Scenario.

The figure displays participants' post-search ratings of the four Model Penal Code culpability levels within each search scenario, as referenced in Chapter 5. Table P2.28 gives the registered RH5.6 comparisons between adjacent levels.

```r
# One row per rating (columns facet = the search scenario, rung, rating), the
chapter's data file. Drawn as the chapter
# drew it (dissAPA::geom_ridges_apa(), one facet per scenario, the 1-7 scale), in
colour, as the chapter first drew it.
p2_rungs <- read_p2("p02_mpc_rungs_long.csv")
if (is.null(p2_rungs)) {
  knitr::asis_output("The mens-rea distributions render once
p02_mpc_rungs_long.csv has been exported.")
} else {
  p2_r <- as.data.frame(p2_rungs)
  p2_r$facet <- factor(p2_r$facet, levels = c("Self-managed abortion", "Ordinary
miscarriage", "Criminal miscarriage"))
  p2_r$rung  <- factor(p2_r$rung, levels = c("Negligently", "Recklessly",
"Knowingly", "Purposely"))
  stopifnot("p02_mpc_rungs_long.csv carries a scenario or rung label this figure
does not know" = !anyNA(p2_r$facet) && !anyNA(p2_r$rung))
  dissAPA::geom_ridges_apa(p2_r, x = rating, y = rung, fill = rung, palette =
"apa", x_lab = "Mens-rea rating (1–7)") +
    ggplot2::facet_wrap(~ facet) +
    ggplot2::coord_cartesian(xlim = c(1, 7))
}
```

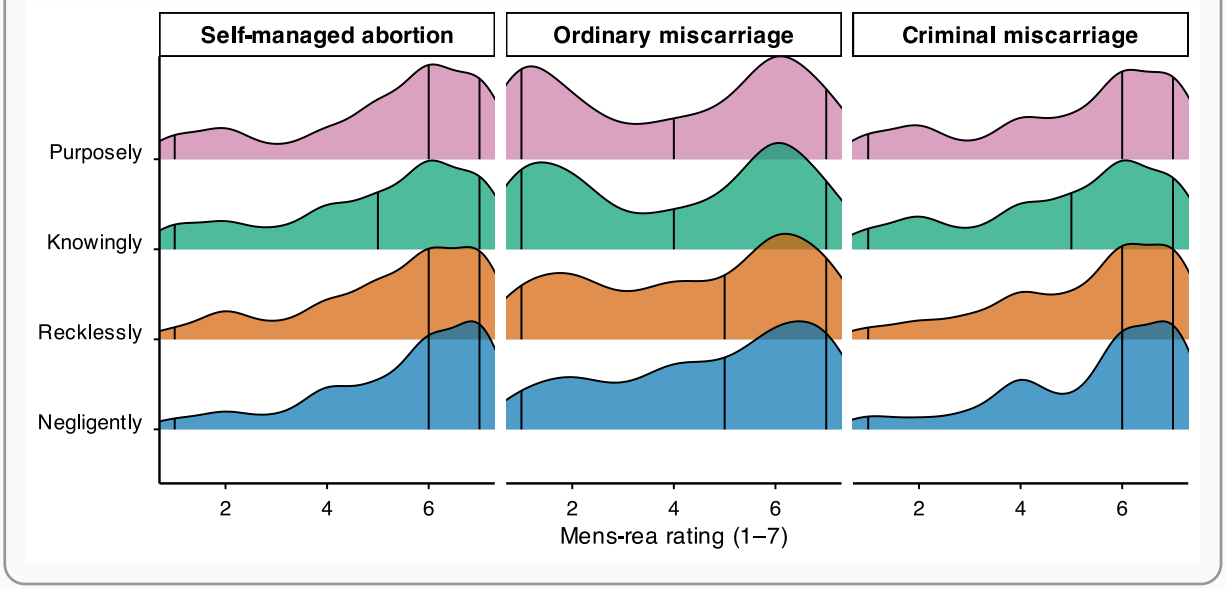
Figure P2.5

Pilot 2 density of the post-search mens-rea ratings (1–7) for each Model Penal Code culpability level, by search scenario. Lines mark the median and 95% interval of each distribution.



Robustness Diagnostics.

The registered RH5.6 decision rests on the adjacent-level contrasts in Table P2.28. Table P2.27 describes the probability of the complete ordering; Table P2.34 retains the earlier simulated ordering summaries for the nothing-incriminating outcome.

RH5.6 requires the 95% HDIs for purposely minus knowingly and recklessly minus negligently to lie above zero in both outcome conditions. I also report knowingly minus recklessly, although the rule does not require it. The result appears as H5d in Mens Rea Hierarchy (H5d). For RH5.4, Table P2.29 compares the sensitivity estimates with the primary estimate, indicating agreement in sign and whether each interval excludes zero.

Registered Analyses Reported in the Supplement

Of the three registered predictions reported here, H2a concerned whether guilt-probability ratings changed more after expected than unexpected evidence, particularly in the two criminal-conduct scenarios. I expected the narrative-prototype ordering of the scenarios to hold for pregnancy-specific likelihood changes after expected evidence (H2c), and the Model Penal Code culpability hierarchy to hold for mental-state ratings within each evidence condition (H5d). None of the three predictions met all registered support criteria.

For the observed means and standard deviations, I averaged each participant's ratings over the three scenarios. Model estimates are posterior medians with 95% HDIs; probability of direction (pd) is the proportion of draws with the median's sign. Differences in likelihood and guilt probability retain the 0–100 units.

Content Match: Subjective Probability of Guilt (H2a)

I predicted that, after expected incriminating evidence, participants would inflate the subjective probability of the suspect's guilt relative to their own pre-search ratings, more so than after unexpected incriminating evidence, and more so in the self-managed abortion and criminal miscarriage scenarios than in the non-criminal miscarriage scenario (H2a).

Consistent with the first part of H2a, the change in the subjective probability of the suspect's guilt from before to after the search outcome was larger after expected than after unexpected incriminating evidence (16.49, 95% HDI [12.60, 20.47], pd > 99.9%). After expected incriminating evidence, ratings rose from before the search outcome (M = 61.16, SD = 22.26) to after it (M = 69.83, SD = 22.81), an estimated change of 8.55, 95% HDI [5.70, 11.36]; after unexpected incriminating evidence, they fell (before: M = 62.55, SD = 24.10; after: M = 54.50, SD = 25.52), an estimated change of −7.94, 95% HDI [−10.73, −5.20]. Contrary to the second part of H2a, the increase after expected incriminating evidence was not reliably larger in the self-managed abortion and criminal miscarriage scenarios than in the non-criminal miscarriage scenario (posterior probability .103, below the registered threshold). Descriptively, it was largest in the non-criminal miscarriage scenario (10.90) and smaller in the self-managed abortion (8.60) and criminal miscarriage (6.16) scenarios.

Registered verdict. Not supported by all registered criteria.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Inevitability (H2c)

I further predicted that the change in the pregnancy-specific likelihood would follow the narrative-prototype pattern (criminal miscarriage > self-managed abortion > non-criminal miscarriage; H2c).

H2c predicted the largest increase in disposal or concealment likelihood in the criminal miscarriage scenario after expected incriminating evidence. However, its change did not credibly exceed zero (−0.81, 95% HDI [−5.75, 3.92], pd = 62.9%), nor did the changes in the other two scenarios, and the probability of the predicted ordering was below .001. The non-criminal miscarriage comparison also ran contrary to the prediction: the mean of the two pregnancy items increased (95% HDI [8.43, 15.16]).

Registered verdict. Not supported by all registered criteria. I checked convergence for all parameters and for the registered coefficients separately, using the criteria in Appendix G. The all-parameter check failed. Neither diagnostic reading supported H2c; a failed convergence criterion precludes registered support.

Mens Rea Hierarchy (H5d)

I predicted the Model Penal Code culpability ordering in participants' mental-state ratings within each evidence condition (H5d).

H5d was not supported in either evidence condition. Participants gave higher ratings to *purposely* than to *knowingly* after expected incriminating evidence (0.13, 95% HDI [0.02, 0.25], pd = 98.7%). The purposely-minus-knowingly difference after unexpected incriminating evidence had a 95% HDI that included zero (−0.05, 95% HDI [−0.17, 0.06], pd = 82.4%). The 95% HDI of recklessly minus negligently included zero after expected incriminating evidence (−0.02, 95% HDI [−0.16, 0.11], pd = 63.8%) and lay below zero after unexpected incriminating evidence (−0.44, 95% HDI [−0.58, −0.31], pd > 99.9%). Participants rated recklessly above knowingly after expected (−0.21, 95% HDI [−0.36, −0.08], pd = 99.9%) and unexpected incriminating evidence (−0.45, 95% HDI [−0.58, −0.31], pd > 99.9%): both knowingly-minus-recklessly intervals lay below zero. This comparison is reported but is not a required part of the registered decision.

Registered verdict. Not supported by all registered criteria.

Likelihood Changes and Parallel-Then-Serial Pathways

I examined the changes in likelihood after the search outcome in E2.3, including termination likelihood after unexpected evidence. E2.4 compared the expected-evidence change in termination minus concealment likelihood between self-managed abortion (i.e., SMA) and criminal miscarriage (i.e., CM); non-criminal miscarriage (i.e., NCM) remained descriptive. In E5.1, I estimated the two parallel-then-serial indirect effects on blame, their difference, and the remaining direct effect. I report these analyses descriptively, without separate support thresholds.

```r
stopifnot(nrow(p2_e23_cells) == 24L,
          !anyDuplicated(p2_e23_cells[c("outcome", "vignette", "item")]))
p2_e23_cells_display <- bind_cols(
  p2_e23_cells |> transmute(Cell = paste(
    dplyr::recode(outcome, HACE = "Expected outcome", HUCE = "Unexpected
outcome"),
    vignette, sep = " · ")),
  supp_bayes_table(p2_e23_cells, "item_label", digits = 2))
dissAPA::apa_render(p2_e23_cells_display, engine = "auto", group_col = "Cell")
```

)
dissAPA::apa_render(p2_e7_7_tbl, engine = "auto", fontsize = 0.9)
```

Table P2.22

Pilot 2 derived 50%-endorsement decision threshold by search target (exploratory). The subjective probability of guilt (0–1) at which the endorsement model predicts a 0.5 probability of authorizing the search, per target, population-level: posterior median, 95% HDI, and the share of posterior draws with a defined in-range crossover. Descriptive; benchmarked against the Baucum et al. (2018) ascending-invasiveness ordering (reverse keyword < provider text < physical residence), not the numeric thresholds. A dash marks a target whose crossover is undefined in range for most draws.

Search target	Derived threshold (median)	95% HDI	Draws defined
Reverse keyword warrant	0.75	[0.60, 0.91]	100%
Provider text message	0.47	[0.32, 0.63]	100%
Physical residence	0.53	[0.38, 0.68]	100%

Evidence Reinterpretation (RQ3)

RH1.4 was supported on the respecified item-level model (Table P2.23). The interaction of timing, outcome, and key consistency was 0.77, 95% HDI [0.52, 1.02], Pr(effect > 0) > .999, BF_{10} > 1000. The 95% HDI meets the registered rule that it lie above zero. The model met the registered convergence criteria.

I respecified the model because the registered model nests item consistency within outcome. The respecified model codes each item, for every participant, by whether it would be consistent with the expected outcome. After inspecting the raw means, I chose to compare the same items across the randomly assigned outcomes. I made that choice before fitting the revised model. That timing makes the test less severe (see item 9.1 of the Pilot 2 deviations record on the study's OSF page).

The registered model tests the interaction of timing and item consistency, with NCM as the reference vignette (Table P2.24). Its 95% HDI meets the registered criterion of a positive interval. Its registered convergence criteria were met (worst within-imputation R-hat = 1.002, lowest effective sample size = 2250, total divergent transitions = 0). In the eight-item sensitivity analysis without items 3 and 10, the result of the registered model holds (0.68 [0.49, 0.87]). The result of the respecified model does not hold (0.23 [−0.08, 0.54]). Without those two items, its key contrast rests on the NCM vignette alone (see item 9.2 of the deviations record). The change in the observed composite is descriptive. The exploratory tests for each item below keep the registered grouping by vignette.

The registered model had a divergent transition. To address it, I refit the model on the fourth imputed data set with `adapt_delta` = .99 (previously .95) and kept the other four fits. The model, priors, data, random seeds, initial values, and iteration counts did not change.

Robustness Checks

This chapter reports the checks on the RH5.6 ordering and on the H5a model. They include the sensitivity of the H5a result to the priors and exclusions and the predictive checks of the model.

```r
p2_robust_tbl ← p2_d3 |>
  transmute(
    `Search outcome` = dplyr::recode(as.character(outcome),
      HACE = "Expected outcome", HUCE = "Unexpected outcome"),
    `Pr(full ordering)` = vapply(prob_full_monotonic, fmt_pp, character(1)),
    `Pr(at least two ordered steps)` = vapply(prob_2of3_consistent, fmt_pp,
character(1)))
dissAPA::apa_render(p2_robust_tbl, engine = "auto")
```

Table P2.27

Pilot 2 RH5.6 supplementary joint posterior probabilities of full and partial mens rea ordering within each search outcome. These probabilities are descriptive; the registered decision uses the named-step contrasts in Table P2.28.

Search outcome	Pr(full ordering)	Pr(at least two ordered steps)
Expected outcome	< .001	.357
Unexpected outcome	< .001	< .001

```r
p2_d3_adj_tbl ← p2_d3_adj |>
  mutate(
    outcome_label = dplyr::recode(as.character(outcome),
      HACE = "Expected outcome", HUCE = "Unexpected outcome",
      .default = as.character(outcome)),
    est  = paste0(zr_fmt(estimate, 3),
                  ifelse(!is.na(hdi_low) & !is.na(hdi_high) &
                         ((hdi_low > 0 & hdi_high > 0) | (hdi_low < 0 & hdi_high
< 0)),
                         "*", "")),
    ci   = mapply(fmt_ci, hdi_low, hdi_high, digits = 3),
    pp   = vapply(p_gt_0, fmt_pp, character(1)),
    supp = ifelse(supported, "Yes", "No"),
    count = sprintf("%d of 3", n_supported),
    rule = ifelse(rule_met, "Met", "Not met")
  ) |>
  select(outcome_label, contrast, est, ci, pp, supp, count, rule)
```

© 2026 Emma Marshall · CC BY-NC-SA 4.0

```
p2_d3_adj_tbl ← p2_d3_adj_tbl |> dplyr::rename(
  `Adjacent-rung contrast` = contrast,
  `Estimate` = est,
  `95% HDI` = ci,
  `P(> 0)` = pp,
  `Supported` = supp,
  `Supported count` = count,
  `Named-step rule` = rule
)
dissAPA::apa_render(p2_d3_adj_tbl, engine = "auto", group_col = "outcome_label",
fontsize = 0.8)
```

Table P2.28

*Pilot 2 RH5.6 adjacent-rung contrasts by search outcome. The registered named-step rule requires positive 95% HDIs for purposely – knowingly and recklessly – negligently in both outcome conditions; knowingly – recklessly is reported but is not required. The supported-count column is descriptive. * 95% HDI excludes zero.*

Adjacent-rung contrast	Estimate	95% HDI	P(> 0)	Supported	Supported count	Named-step rule
Expected outcome						
purposely - knowingly	0.132*	[0.016, 0.251]	.987	Yes	1 of 3	Not met
knowingly - recklessly	−0.215*	[−0.357, −0.076]	.001	No	1 of 3	Not met
recklessly - negligently	−0.024	[−0.160, 0.112]	.362	No	1 of 3	Not met
Unexpected outcome						
purposely - knowingly	−0.054	[−0.168, 0.060]	.176	No	0 of 3	Not met
knowingly - recklessly	−0.447*	[−0.585, −0.310]	< .001	No	0 of 3	Not met
recklessly - negligently	−0.444*	[−0.579, −0.313]	< .001	No	0 of 3	Not met

```
p2_rob_sum_tbl ← p2_rob_sum |>
  mutate(
    est    = zr_fmt(estimate, 3),
    ci     = mapply(fmt_ci, hdi_low, hdi_high, digits = 3),
```

  `Excludes 0` = excl,
  `Same sign and zero exclusion` = agree
)
dissAPA::apa_render(p2_rob_sum_tbl, engine = "auto", fontsize = 0.9)
```

Table P2.29

Pilot 2 RH5.4 sensitivity summary: primary, no-exclusions, halved-prior, doubled-prior, and presentation-order-adjusted serial indirects. Agreement means the same estimate sign and zero-exclusion status as the primary; it is not a convergence or overall support verdict.

Specification	Indirect	95% HDI	P(> 0)	Excludes 0	Same sign and zero exclusion
Primary (preregistered exclusions, scale-aware priors)	0.220	[−0.030, 0.503]	.962	No	Yes
No exclusions (full-sample refit)	0.218	[−0.020, 0.491]	.966	No	Yes
Prior sensitivity, narrow (x0.5 scale-aware SD)	0.191	[−0.029, 0.428]	.962	No	Yes
Prior sensitivity, wide (x2 scale-aware SD)	0.226	[−0.037, 0.510]	.964	No	Yes
Vignette-order covariate added	0.217	[−0.032, 0.487]	.964	No	Yes

Predictive Checks for the H5a Model

I checked the H5a model's predictions for blame in two ways. The prior predictive check compares observed blame ratings with ratings simulated from the priors alone. After fitting the model, I compared the observed blame ratings with predictions from its posterior.

Simulation and Planning Outputs

I used these simulations to plan Pilot 2 and Study 1 before analyzing the Pilot 2 data. I discontinued these analyses on September 7, 2026, retaining the planning tables outside the Pilot 2 findings and hypothesis decisions.

```r
p2_dd_tbl ← p2_dd_pw |>
  mutate(
    label = contrast |>
      stringr::str_replace_all(stringr::fixed("neg→"), "negligence → ") |>
      stringr::str_replace_all(stringr::fixed("reck→"), "recklessness → "),
    est = zr_fmt(estimate, 3),
    ci  = mapply(fmt_ci, hdi_low, hdi_high, digits = 3),
    pp  = vapply(p_gt_0, fmt_pp, character(1))
  ) |>
  select(label, est, ci, pp)

p2_dd_tbl ← p2_dd_tbl |> dplyr::rename(
  `Route contrast` = label,
  `Difference` = est,
  `95% CrI` = ci,
  `P(difference > 0)` = pp
)
dissAPA::apa_render(p2_dd_tbl, engine = "auto", fontsize = 0.9)
```

Table P2.30

Simulation output from June 20, 2026: pairwise contrasts for the downstream dissociation. These are not results from the Pilot 2 data. Intervals are 95% HDIs, and the probability column is Pr(difference > 0).

Route contrast	Difference	95% CrI	P(difference > 0)
negligence → blame – negligence → punish	0.533	[0.329, 0.731]	> .999
negligence → blame – negligence → resp	0.269	[0.086, 0.448]	.997
negligence → punish – negligence → resp	−0.263	[−0.478, −0.064]	.010

```r

About this document

The full Study 1 models appear in S4, with additional analyses by research question in S5 through S10. Chapter 5 reports the main findings.

I prepared these tables and figures from the final analyses, retaining their estimates. The comparison with the saved analysis results passed on 2026-10-10.

Table and figure numbers identify the section (e.g., Table S4.1 is the first table in S4). I place a table that belongs to several sections in the first one that lists it and use square brackets for references to tables or figures outside this supplement.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

S1. Deviations from the registration

This section describes the five ways the Study 1 analysis departs from the registration. The full deviations record is on the study's OSF page (https://osf.io/93w7p/). The corresponding analysis tables appear after the five entries.

Summary

Item	Category	When decided	Effect on the severity of the test	Effect on validity
1. A sensitivity analysis of E4a without the two background items	Not a deviation	While data collection was under way, before any Study 1 relevance rating was seen	Unchanged. The added analysis appears beside the registered one and was based on the Pilot 2 data alone.	—
2. Pregnancy-evidence likelihood as the mediator for H3c–H3e	A mistake in the study	After data collection ended and before any Study 1 outcome was analyzed	Reduced. The registered mediator was not recorded, so a different registered measure stands in for it and is reported as a substitute.	Lower for the registered construct. The substitute tests the closest measured route.
3. An eight-item, two-factor structure for evidence relevance in a deviation analysis	A violation of an untested assumption	After the Study 1 data had been analyzed	Reduced for the deviation analysis. The registered tests are unchanged.	Lower for the deviation analysis. Its structure fails the registered measurement criteria.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Item	Category	When decided	Effect on the severity of the test	Effect on validity
4. Relative relevance in place of the ten-item mean as the mediator for H1 and H4b–H4d	A mistake in the preregistration	After the Study 1 data had been analyzed (2026-10-01)	Reduced. I chose the new mediator with the registered results in hand. The registered results are reported in this supplement.	Increased. Relative relevance measures the shift that the hypotheses predict.
5. Exploratory tests of nine judgments of the suspect	Not a deviation	After I had seen the Study 1 results (2026-10-01)	Unchanged for every registered test. Low for the added tests.	Unchanged for the registered inferences

Deviations

For each departure, I recorded when I chose it, whether I had seen the data, and the analytic discretion it allowed. Following Lakens (2024), I assessed test severity separately from the validity of the inference. Severity concerns how likely a test is to support a true hypothesis and to withhold support from a false one. A departure can leave severity unchanged, reduce it, or increase it; improving validity does not necessarily make a test more severe.

The five overlapping categories are unforeseen events, mistakes in the preregistration or study, missing information, violations of untested assumptions, and falsified auxiliary hypotheses. Each entry assesses severity, and entries involving a mistake, violated assumption, or falsified auxiliary hypothesis also assess validity. I retained the decision rules in the preregistration and its supplement.

1. E4a Sensitivity Analysis

Registered on 2026-09-21. Added on 2026-09-25, while Study 1 data collection was under way and before any relevance rating had been analyzed.

What was registered. E4a concerns whether self-managed abortion (SMA) evidence increases the relevance of outcome-consistent items more than inconsistent items. Its parameter is the SMA × Consistency interaction in

© 2026 Emma Marshall · CC BY-NC-SA 4.0

```
relevance ~ outcome × consistency + legal context + attitudes + (1 + consistency |
participant) + (1 | item)
```

with items 1, 6, and 7 coded consistent and the other seven coded inconsistent (analysis supplement, §E4a).

What I added. I reran E4a without the employment item (3) and the age and household item (10), using the same model and decision rule on the remaining eight items. The ten-item analysis remains the registered result; I report the sensitivity analysis beside it.

Why. In Pilot 2, items 3 and 10 received the lowest relevance ratings, changed little with the search outcome, and formed a separate background factor in every vignette. Study 1 largely retained the wording and consistency coding from the non-criminal miscarriage vignette, where both items were coded inconsistent. The E4a contrast could therefore partly compare information about the loss with background details. In that Pilot 2 vignette, the raw difference-in-differences was +0.87 with the background items and +0.50 without them (Pilot 2 deviations record, §9.2). I used the eight-item version to check E4a's dependence on those items.

Category. Not a deviation. I added a sensitivity analysis based only on Pilot 2, before Study 1 data collection ended and before I saw any Study 1 relevance rating. The registered analysis and its severity are unchanged.

2. Substitute Mediator (H3c–H3e)

Registered on 2026-09-21. Recorded on 2026-09-26, after Study 1 data collection ended and before any Study 1 outcome had been analyzed.

What was registered. H3c–H3e test whether outcome information relates to blame of the suspect indirectly, "through how likely participants think it is that the suspect committed the offense." The indirect effect was predicted to be positive after SMA evidence (H3c) and negative after financial-crime evidence (H3d), each compared with no outcome information. H3e predicts a more positive indirect effect after SMA than financial-crime evidence. I specified separate groups for the two legal contexts, adjusting each equation for the four attitudes. Percentile 95% bootstrap intervals (10,000 samples) evaluate the indirect effects and their difference; robust Wald intervals describe the individual paths. The model is estimated again without the attitudes, and support is read on the indirect effects alone (analysis supplement, "Probability and blame (H3c–H3e)" and Figure 4). The registered mediator is a single item rated from 0 to 100: "Based on the evidence available at the time the warrant was sought, what is the probability that the suspect committed the crime the detective suspects her of committing?"

What happened. A technical glitch prevented the survey from displaying the probability-of-guilt question, leaving no responses to the registered mediator.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

What the analysis does instead. I retained the H3c–H3e model, intervals, and decision rules but supplied pregnancy-evidence likelihood as the mediator. This registered 0–100 composite combines the likelihood ratings for abortion and disposal evidence and is also the mediator in E9a–E9b. S7 reports the analysis as a substitute. Chapter 5 reports H3a–H3b's registered blame comparisons and explains in a footnote why H3c–H3e could not be tested as registered.

Why this measure. I chose pregnancy-evidence likelihood because a judgment that the search would uncover evidence of an offense bears on whether the suspect committed it, the relationship posited in H3c–H3e. Foreseeability measures predictability from the detective's perspective; E9 specifies no directional prediction through it. Pregnancy-evidence likelihood addresses the related likelihood question, but it does not directly measure the probability of guilt.

Category. A mistake in the study: the survey omitted a registered item. I chose the existing pregnancy-evidence measure after data collection ended but before analyzing any Study 1 outcome or examining a likelihood or blame value. I considered no other candidate. With the registered mediator unavailable, I cannot assess the severity of that test. I report the substitute's verdicts only for the related question it answers.

3. Evidence-Relevance Structure

Registered on 2026-09-21. Recorded on 2026-10-01, after the Study 1 data had been analyzed.

What was registered. The measurement procedure chooses a factor structure for the ten relevance ratings with parallel analysis, a screen that requires at least three items per factor, and registered fit criteria. If no structure qualifies, the analyses use the ten-item mean. The procedure makes no provision for removing items. With more than one factor, each factor is a separate mediator, and the decision reads the sum across factors (analysis supplement, measurement and H1 sections).

What happened. No structure qualified, so every registered analysis uses the ten-item mean, and those results stand. The three-factor pattern failed the screen because its third factor had only two items. Both items described the suspect's background. Item 3 said that she had held a stable job for several years, and item 10 said that she was 32 years old and lived with her husband.

What I added. Without items 3 and 10, the other eight items formed two factors. Items 1, 6, and 7 formed one factor, and items 2, 4, 5, 8, and 9 formed the other. This is the item-consistency key of E4a. I adopted this structure because of the content of the items, not by the registered rule, and it fails the registered fit criteria. I refit the six structural models that use the relevance mediator with this structure (H1a–H1d and E1a–E1b; H2a–H2b; E6a–E6f; E12a–E12d; H4b–H4d). These analyses applied the registered decision rules to the sum across

© 2026 Emma Marshall · CC BY-NC-SA 4.0

factors, with 10,000 bootstrap attempts. I made no decision for E12a–E12c because fewer attempts were usable than the registration requires. These supplementary results accompany the registered results without replacing them. All Study 1 analyses used 10,000 bootstrap attempts, including this analysis.

Category. A violation of an untested assumption (i.e., that each indicated factor would have at least three qualifying items). I decided on this analysis after the data had been analyzed, so it tests the hypotheses less severely than the registered analysis.

4. Relative Relevance (H1; H4b–H4d)

Registered on 2026-09-21. Decided on 2026-10-01, after the Study 1 data had been analyzed.

What was registered. H1 and H4b–H4d predict that outcome information changes the relevance of fitting evidence relative to non-fitting evidence. The structural models use evidence relevance as the mediator, which the registered measurement procedure made the ten-item mean (see item 3). Only E4a tests the relative item-level change directly, and that model has no likelihood outcome.

What the analysis does instead. In the Chapter 5 H1 and H4b–H4d analyses, I supplied relative relevance as the observed mediator: the mean for items consistent with self-managed abortion (i.e., items 1, 6, and 7, as coded for E4a) minus the mean for the remaining items. I used the ten-item key for the primary analysis and omitted background items 3 and 10 for the sensitivity analysis (see item 1). An added step supplied the mediator to the unchanged registered code. Models, samples, grouping and constraints, covariates, missing-data handling, the 10,000-attempt participant bootstrap, and decision rules remained as registered. Because the key codes fit to the self-managed abortion outcome only, relative relevance does not test sense-making after financial-crime evidence (H1b and H4c). The registered results based on the ten-item mean for all of these hypotheses, and the two-factor analysis from item 3, are reported in this supplement.

Why. The consistent-minus-inconsistent mean measures the relative change even when the mean across all ten items stays constant or falls.

Category. A mistake in the preregistration. I could have recognized the mismatch between the mean and the predicted quantity before collecting data, but chose the replacement only after seeing the registered results. This choice reduced the severity of the relative-relevance tests, although it improved construct validity. Their H1a–H1d and H4b–H4d decisions may differ from the registered decisions.

5. Exploratory Suspect Judgments

Registered on 2026-09-21. Tests added on 2026-10-01, after I had seen the Study 1 results.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

What was registered. H3a–H3b compare suspect blame across outcome conditions using an Outcome × Legal Context analysis of covariance; E7a–E7g use that model for punishment, recklessness, and negligence. E8b jointly models responsibility and the wrongness of the suspect's conduct with blame and punishment, while the sample descriptions report that wrongness rating by condition (analysis supplement, "Sample descriptions and evidence measurement"). The registration provides no test of causality, preventability, favorable impression, justified reasons, wrongness apart from the law, wrongness given the charge, or counterfactual availability (study materials, sections H and I). Earlier E6a–E6c plans covered causality, preventability, and favorable impression but were withdrawn before registration.

What I added. After seeing the Study 1 results, I added tests on 2026-10-01 for nine judgments: causality, preventability, favorable impression, justified reasons, wrongness apart from the law, wrongness given the charge, counterfactual availability, the wrongness of the suspect's conduct, and responsibility. I used the H3a–H3b blame model, substituting each judgment as the outcome. For each, I compared expected evidence with no information, unexpected evidence with no information, and expected with unexpected evidence, weighting the two legal contexts equally. The comparisons use Student *t* 95% intervals from the conventional covariance, with and without the four attitudes, in the analysis sample ($N = 398$) and registered sensitivity sample ($N = 341$). Although E8b includes responsibility and wrongness, its joint model gives normal Wald intervals; these additional tests give the blame model's *t* intervals. The model with the registered covariates and sample adds 27 tests (i.e., nine judgments with three comparisons each), and the three companion versions add 81. I applied no multiplicity correction, consistent with the registered single-judgment comparisons.

Why. I added the pairwise comparisons to report judgments of the women consistently across studies.

Category. Not a deviation. These exploratory additions carry no letter or decision and do not alter any registered model, rule, test, or verdict. I chose them with the results in view, so their severity is low; the severity of the registered tests is unchanged.

Deviation Tables

Table S1.1

Two-factor evidence relevance (documented deviation): the eight relevance items, their factors and markers

Item	Wording	Factor	Marker	EFA loading
1	That an anonymous coworker reported that the suspect was no longer pregnant	Factor 1		.615

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Item	Wording	Factor	Marker	EFA loading
6	suspect said she was alone when she lost her pregnancy at home	Factor 1		.657
7	suspect retrieved the remains from the toilet and buried them in her backyard	Factor 1	Yes	.733
2	suspect had been trying to conceive and was openly excited about her pregnancy	Factor 2	Yes	.847
4	suspect had told her husband, her doctor, and her workplace about her pregnancy	Factor 2		.807
5	suspect had been receiving prenatal care from an obstetrician	Factor 2		.783
8	suspect sought emergency care at the hospital after losing her pregnancy	Factor 2		.647
9	suspect experienced cramping and heavy bleeding and was treated for hemorrhage and retained tissue	Factor 2		.452
3	suspect had held a stable job for several years	Dropped		—
10	suspect was 32 years old and lived with her husband	Dropped		—

Note. Factor 1: coefficient H = .669, AVE = .421, α = .702; factor 2: H = .859, AVE = .550, α = .869 (H and AVE: means over the six conditions of the scalar fit's model-implied values; α over complete responses). Eight items together: α = .833. Assignment and markers by the pattern rule of the analysis (highest absolute loading); the assignment equals the item-consistency key. EFA loadings: minres, oblimin, within-condition centered items. Documented deviation: not the registered measurement decision, which is the ten-item mean.

Note. Deviation analysis (documented deviation): evidence relevance is measured by two latent factors from eight of the ten relevance items (items 3 and 10 dropped), and each factor is a separate mediator. For a relevance pathway the estimate is the sum across factors, the quantity the registration names and the one the registered decision rule reads ("the indirect association through each factor and the sum across factors"); the per-factor components carry no decision rule. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported above, unchanged. Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 10,000 usable. — = no factor component (not a relevance pathway). Primary set: grouped, as in the registered run. H1c and H1d run through consequence severity, which the deviation does not change; they are re-estimated in the deviation model. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S1.3

Two-factor evidence relevance (documented deviation): paths of the hindsight-pathway model through the two relevance factors, by legal context

Path	Illegal abortion		Improper disposal		Equal across contexts
	b (SE)	95% CI	b (SE)	95% CI	
a paths: outcome information → relevance factor					
Expected evidence → Factor 1	−0.187 (0.346)	[−0.864, 0.490]	0.576 (0.325)	[−0.062, 1.214]	No
Unexpected evidence → Factor 1	−0.483 (0.402)	[−1.270, 0.305]	−0.228 (0.383)	[−0.978, 0.522]	No
Expected evidence → Factor 2	−1.478 (0.382)	[−2.227, −0.729]	−1.179 (0.336)	[−1.837, −0.521]	No
Unexpected evidence → Factor 2	−0.871 (0.439)	[−1.731, −0.011]	−0.741 (0.414)	[−1.552, 0.070]	No
b paths: relevance factor → pregnancy-evidence likelihood					
Factor 1 → pregnancy-evidence likelihood	5.650 (1.062)	[3.569, 7.731]	5.650 (1.062)	[3.569, 7.731]	Yes
Factor 2 → pregnancy-evidence likelihood	−2.048 (0.742)	[−3.504, −0.593]	−2.048 (0.742)	[−3.504, −0.593]	Yes

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Path	Illegal abortion b (SE)	Illegal abortion 95% CI	Improper disposal b (SE)	Improper disposal 95% CI	Equal across contexts

Note. Deviation analysis, registered model with the attitudes, primary sample. Unstandardized estimates in the original units (relevance factors on the 1–9 item scale of their marker items) with robust standard errors and normal Wald 95% intervals; a paths are estimated in each legal context and b paths are shared, as registered. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S1.4

Two-factor evidence relevance (documented deviation): global fit of the hindsight-pathway model, beside the registered model

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
Deviation analysis (two factors)					
Registered model	332.61 (191)	< .001	.932	.062 [.050, .074]	.060
Without attitudes	246.83 (123)	< .001	.918	.074 [.060, .088]	.070
Pooled contexts	341.50 (197)	< .001	.930	.062 [.050, .073]	.062
Pooled contexts, without attitudes	255.51 (129)	< .001	.917	.073 [.060, .086]	.073
Registered (ten-item mean)					
Registered model	23.31 (26)	.616	1.000	.000 [.000, .049]	.027
Without attitudes	16.07 (10)	.098	.978	.056 [.000, .103]	.038
Pooled contexts	31.15 (30)	.408	.999	.012 [.000, .056]	.034
Pooled contexts, without attitudes	24.11 (14)	.044	.963	.060 [.010, .100]	.050

Note. Primary sample. The two-factor model has more observed variables (eight relevance items instead of their mean), so its degrees of freedom and indices are not comparable with the registered model's in size. RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).

Pathway	Letter	Deviation analysis: Through factor 1	Through factor 2	Estimate [95% CI]	Decision	Registered, ten-item mean: Estimate [95% CI]	Decision

Note. Deviation analysis (documented deviation): evidence relevance is measured by two latent factors from eight of the ten relevance items (items 3 and 10 dropped), and each factor is a separate mediator. For a relevance pathway the estimate is the sum across factors, the quantity the registration names and the one the registered decision rule reads ("the indirect association through each factor and the sum across factors"); the per-factor components carry no decision rule. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported above, unchanged. Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 9,996 usable. — = no factor component (not a relevance pathway). E6a and E6b are direct paths (robust Wald intervals, as registered); E6c–E6f are serial products (bootstrap intervals). E6e and E6f run through consequence severity and have no factor components. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S1.10

Two-factor evidence relevance (documented deviation): paths of the decision-quality model through the two relevance factors, by legal context

Path	Illegal abortion: b (SE)	95% CI	Improper disposal: b (SE)	95% CI	Equal across contexts
a paths: outcome information → relevance factor					
Expected evidence → Factor 1	−0.176 (0.344)	[−0.851, 0.499]	0.581 (0.324)	[−0.053, 1.216]	No
Unexpected evidence → Factor 1	−0.477 (0.400)	[−1.261, 0.307]	−0.222 (0.380)	[−0.967, 0.522]	No
Expected evidence → Factor 2	−1.478 (0.382)	[−2.227, −0.729]	−1.179 (0.336)	[−1.837, −0.520]	No

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Path	Illegal abortion		Improper disposal		Equal across contexts
	b (SE)	95% CI	b (SE)	95% CI	
Unexpected evidence → Factor 2	−0.871 (0.439)	[−1.731, −0.011]	−0.740 (0.414)	[−1.551, 0.071]	No
b paths: relevance factor → pregnancy-evidence likelihood					
Factor 1 → pregnancy-evidence likelihood	5.693 (1.065)	[3.606, 7.781]	5.693 (1.065)	[3.606, 7.781]	Yes
Factor 2 → pregnancy-evidence likelihood	−2.048 (0.743)	[−3.504, −0.592]	−2.048 (0.743)	[−3.504, −0.592]	Yes

Note. Deviation analysis, the H2a–H2b model (the model E6 reads), registered model with the attitudes, primary sample. Unstandardized estimates in the original units (relevance factors on the 1–9 item scale of their marker items) with robust standard errors and normal Wald 95% intervals; a paths are estimated in each legal context and b paths are shared, as registered. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S1.11

Two-factor evidence relevance (documented deviation): global fit of the decision-quality model, beside the registered model

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
Deviation analysis (two factors)					
Registered model	392.74 (219)	< .001	.929	.064 [.054, .075]	.061
Without attitudes	307.42 (151)	< .001	.914	.075 [.063, .087]	.073
Pooled contexts	408.46 (235)	< .001	.929	.062 [.051, .072]	.063
Pooled contexts, without attitudes	320.60 (163)	< .001	.913	.072 [.060, .084]	.076

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
Registered (ten-item mean)					
Registered model	26.85 (28)	.527	1.000	.000 [.000, .052]	.026
Without attitudes	20.47 (12)	.059	.985	.059 [.000, .102]	.037
Pooled contexts	41.63 (42)	.487	1.000	.000 [.000, .048]	.034
Pooled contexts, without attitudes	32.82 (22)	.064	.980	.051 [.000, .085]	.048

Note. Primary sample; E6 reads the same model. The two-factor model has more observed variables (eight relevance items instead of their mean), so its degrees of freedom and indices are not comparable with the registered model's in size. RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).

Table S1.12

Two-factor evidence relevance (documented deviation): variance explained in each equation of the decision-quality model, by legal context

Equation	Illegal abortion	Improper disposal
Factor 1 (items 1, 6, 7)	.117	.127
Factor 2 (items 2, 4, 5, 8, 9)	.079	.063
Consequence severity	.030	.089
Pregnancy-evidence likelihood	.273	.262
Foreseeability	.099	.111
Decision quality	.507	.555

Note. R^2 of each endogenous variable of the deviation H2a–H2b model with the attitudes (lavaan), primary sample, by legal context.

		Deviation analysis				Registered, ten-item mean	
Pathway	Letter	Through factor 1	Through factor 2	Estimate [95% CI]	Decision	Estimate [95% CI]	Decision

Note. Deviation analysis (documented deviation): evidence relevance is measured by two latent factors from eight of the ten relevance items (items 3 and 10 dropped), and each factor is a separate mediator. For a relevance pathway the estimate is the sum across factors, the quantity the registration names and the one the registered decision rule reads ("the indirect association through each factor and the sum across factors"); the per-factor components carry no decision rule. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported above, unchanged. Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 7,912 usable. That is below the registered minimum of 9,500 usable attempts, so these bootstrap estimates are marked unstable and the decision rule returns "unavailable"; their intervals use the usable attempts and are not definitive. — = no factor component (not a relevance pathway). Units: probit units of the ruling per outcome contrast (the ruling's latent response). The deviation run also refitted the registered observed-score companion of E12a–E12c (the ten-item mean). Its point estimates equal the registered ones (largest absolute difference 0). Its intervals use only the attempts in which every version of the deviation model fitted (7,912 in the primary sample, compared with 9,919 in the registered analysis), so they differ from the registered intervals by up to 0.86. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

		Deviation analysis				Registered, ten-item mean	
Pathway	Letter	Through factor 1	Through factor 2	Estimate [95% CI]	Decision	Estimate [95% CI]	Decision

Note. Deviation analysis (documented deviation): evidence relevance is measured by two latent factors from eight of the ten relevance items (items 3 and 10 dropped), and each factor is a separate mediator. For a relevance pathway the estimate is the sum across factors, the quantity the registration names and the one the registered decision rule reads ("the indirect association through each factor and the sum across factors"); the per-factor components carry no decision rule. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported above, unchanged. Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 10,000 usable. — = no factor component (not a relevance pathway). E12d is registered as estimates without a decision rule. Units: confidence points (0–100) per outcome contrast. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S1.18

Two-factor evidence relevance (documented deviation): paths of the probable cause–confidence model through the two relevance factors, by legal context

	Illegal abortion		Improper disposal		
Path	b (SE)	95% CI	b (SE)	95% CI	Equal across contexts
a paths: outcome information → relevance factor					
Expected evidence → Factor 1	−0.187 (0.346)	[−0.864, 0.490]	0.576 (0.325)	[−0.062, 1.214]	No
Unexpected evidence → Factor 1	−0.483 (0.402)	[−1.270, 0.305]	−0.228 (0.383)	[−0.978, 0.522]	No
Expected evidence → Factor 2	−1.478 (0.382)	[−2.227, −0.729]	−1.179 (0.336)	[−1.837, −0.521]	No

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Path	Illegal abortion		Improper disposal		Equal across contexts
	b (SE)	95% CI	b (SE)	95% CI	
Unexpected evidence → Factor 2	−0.871 (0.439)	[−1.731, −0.011]	−0.741 (0.414)	[−1.552, 0.070]	No
b paths: relevance factor → pregnancy-evidence likelihood					
Factor 1 → pregnancy-evidence likelihood	5.650 (1.062)	[3.569, 7.731]	5.650 (1.062)	[3.569, 7.731]	Yes
Factor 2 → pregnancy-evidence likelihood	−2.048 (0.742)	[−3.504, −0.593]	−2.048 (0.742)	[−3.504, −0.593]	Yes

Note. Deviation analysis, the H4b–H4d model with the attitudes, primary sample. Unstandardized estimates in the original units (relevance factors on the 1–9 item scale of their marker items) with robust standard errors and normal Wald 95% intervals; a paths are estimated in each legal context and b paths are shared, as registered. The E12 models share these first-stage equations. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S1.19

Two-factor evidence relevance (documented deviation): global fit of the probable cause–confidence and ruling-confidence models, beside the registered models

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
H4b–H4d: Deviation analysis (two factors)					
Registered model	380.95 (209)	< .001	.925	.066 [.055, .076]	.065
Without attitudes	300.52 (141)	< .001	.907	.078 [.066, .091]	.079
Pooled contexts	399.14 (223)	< .001	.923	.064 [.054, .075]	.067
Pooled contexts, without attitudes	315.10 (151)	< .001	.904	.077 [.065, .089]	.082

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
H4b–H4d: Registered (ten-item mean)					
Registered model	33.71 (30)	.293	.996	.025 [.000, .062]	.031
Without attitudes	25.36 (14)	.031	.973	.066 [.021, .106]	.046
Pooled contexts	50.56 (42)	.171	.991	.032 [.000, .061]	.040
Pooled contexts, without attitudes	39.13 (22)	.014	.960	.064 [.029, .096]	.059
E12d: Deviation analysis (two factors)					
Registered model	350.12 (209)	< .001	.932	.059 [.048, .070]	.059
Without attitudes	266.34 (141)	< .001	.918	.070 [.056, .082]	.068
E12d: Registered (ten-item mean)					
Registered model	27.99 (30)	.571	1.000	.000 [.000, .050]	.028
Without attitudes	21.55 (14)	.088	.972	.054 [.000, .095]	.039

Note. Primary sample. The two-factor models have more observed variables (eight relevance items instead of their mean), so their degrees of freedom and indices are not comparable with the registered models' in size. RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).

Table S1.20

Two-factor evidence relevance (documented deviation): variance explained in each equation of the probable cause–confidence model, by legal context

Equation	Illegal abortion	Improper disposal
Factor 1 (items 1, 6, 7)	.117	.126
Factor 2 (items 2, 4, 5, 8, 9)	.079	.063
Consequence severity	.030	.089
Pregnancy-evidence likelihood	.273	.262
Foreseeability	.099	.111
Scalar probable cause–confidence	.319	.470

Note. R^2 of each endogenous variable of the deviation H4b–H4d model with the attitudes (lavaan), primary sample, by legal context.

S2. Measurement and reliability

Table S2.1

Cronbach's alpha with Feldt 95% intervals for every scored composite, primary sample

Scale	n complete	k	alpha	alpha 95% CI
Pregnancy-evidence likelihood	398	2	.68	[.61, .73]
Foreseeability	398	4	.83	[.80, .85]
Decision quality	398	5	.95	[.95, .96]
Evidence relevance	398	10	.83	[.80, .85]
Culpability	398	4	.95	[.94, .95]
Abortion attitudes	398	14	.97	[.96, .97]
Support for punishment	398	6	.85	[.83, .88]
Benevolent sexism	398	6	.86	[.84, .88]
Hostile sexism	398	6	.94	[.93, .95]
Religiosity	398	4	.93	[.91, .94]

Note. Raw-score Cronbach's α on the participants with every item of the composite, after the registered reversals; religiosity is α of the four items standardized against the primary sample's item reference. The 95% interval is the Feldt normal-theory interval (psych::alpha.ci), as registered. Every composite's α was estimated.

Table S2.2

Parallel analysis: observed and simulated eigenvalues of the within-condition item correlations

Factor	Observed eigenvalue	Simulated eigenvalue		Observed exceeds the 95th percentile	Factor indicated
		Mean	95th percentile		
1	3.529	0.518	1.043	yes	yes
2	0.759	0.196	0.244	yes	yes
3	0.520	0.139	0.179	yes	yes
4	0.048	0.089	0.123	no	no
5	−0.075	0.044	0.074	no	no
6	−0.113	−0.001	0.031	no	no
7	−0.194	−0.043	−0.015	no	no

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Factor	Observed eigenvalue	Simulated eigenvalue		Observed exceeds the 95th percentile	Factor indicated
		Mean	95th percentile		
8	−0.249	−0.088	−0.056	no	no
9	−0.312	−0.138	−0.100	no	no
10	−0.383	−0.197	−0.149	no	no

Note. psych::fa.parallel() on the within-condition correlation matrix with n = 392 (complete responses minus the six condition means), minimum-residual factor extraction and 1000 normal-reference datasets; seed 9152605. Factors indicated: 3. psych counts factors against the 95th percentile of the simulated eigenvalues (the 0.95 quantile) and returns their mean, which the mean column shows. The simulated eigenvalues at the 95th percentile come from a recomputation of this simulation. Its observed and mean eigenvalues match the saved results. Warnings: An ultra-Heywood case was detected. Examine the results carefully

Table S2.3

Candidate measurement models and the registered selection

Candidate	Item pattern admissible	All three fits admissible	Registered criteria met	Scalar BIC	Selected	Reason
One-factor	yes	no	no		no	At least one invariance fit failed numerical requirements
Three-factor	no	no	no		no	Fewer than three qualifying indicators on a factor

Note. Decision: the ten-item mean (observed-score fallback) (No admissible scalar measurement model). A candidate is selected only if its configural, metric and scalar fits are admissible and meet the registered criteria; among those, the lowest scalar BIC wins unless a model with fewer factors is within the tie margin. No modification index or partial invariance is used.

Table S2.4

Fit of each candidate at each invariance step: scaled test statistic and indices

Model	chi2	df	p	chi2/ df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR	AIC	BIC
One-factor, Metric	665.38	255	< .001	2.61	0.671	0.651	0.156	[0.142, 0.169]	0.149	506.8	1045.0
One-factor, Scalar	752.50	300	< .001	2.51	0.637	0.673	0.151	[0.138, 0.164]	0.162	498.3	857.0

Note. χ^2 = Yuan–Bentler scaled χ^2 (MLR; lavaan test yuan.bentler.mplus), with its df and p; CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation (with 90% CI); SRMR = standardized root mean square residual. CFI, TLI and RMSEA (with its 90% CI) are computed from the scaled χ^2 (lavaan's .scaled indices). Every model used estimator MLR (lavaan reports ML with robust.huber.white standard errors), missing = ml, the six conditions as groups, loadings and intercepts constrained to equality as named in the row. The registered selection reads the robust CFI and RMSEA and the SRMR (next table); this table gives the scaled set in the house reporting format.

Table S2.5

Invariance sequence of each candidate against the registered criteria

Model	Numerical requirements	Scaled χ^2 (df)	Robust CFI	Robust RMSEA [90% CI]	SRMR	Delta CFI	Delta RMSEA	Delta SRMR	Criterion met
One-factor, Configura	failed: SEM projected gradient is too large: 0.000241695.	—	—	—	—	—	—	—	not evaluated
One-factor, Metric	met	665.38 (255)	.714	.165 [.150, .180]	.149	—	—	—	not evaluated

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Model	Numerical requirements	Scaled χ^2 (df)	Robust CFI	Robust RMSEA [90% CI]	SRMR	Delta CFI	Delta RMSEA	Delta SRMR	Criterion met
One-factor, Scalar	met	752.50 (300)	.691	.158 [.144, .172]	.162	−.023	−.007	.013	not evaluated

Note. Configural: robust CFI at least 0.9, robust RMSEA at most 0.08 and SRMR at most 0.08. Each added set of equalities may lower CFI by at most 0.01 and raise RMSEA by at most 0.015, and SRMR may rise by at most 0.03 (metric) or 0.01 (scalar). A step's criterion is the analysis's own verdict. The analysis evaluates the criteria only when all three fits meet its numerical requirements; a change is shown only between two adjacent fits that met them. Scaled χ^2 is the Yuan–Bentler statistic of the MLR fit; CFI and RMSEA are lavaan's robust indices, which the registered criteria read.

Table S2.6

Alternative measurement structures, ten items: the two- and three-factor pattern loadings

	Two factors			Three factors			
Item	E1	E2	Factor	E1	E2	E3	Factor
1	.61	−.06	E1	.59	−.07	.10	E1
2	−.07	.83	E2	−.09	.84	.01	E2
3	.02	.32	E2	−.03	.04	.67	E3
4	−.06	.82	E2	−.07	.77	.10	E2
5	.01	.80	E2	−.004	.76	.10	E2
6	.67	.05	E1	.66	−.02	.22	E1
7	.73	−.01	E1	.72	.07	−.09	E1
8	.22	.61	E2	.20	.70	−.10	E2
9	.39	.42	E2 (not qualifying)	.37	.51	−.10	E2 (not qualifying)
10	.13	.36	E2	.10	.07	.70	E3

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	Two factors			Three factors			
Item	E1	E2	Factor	E1	E2	E3	Factor

Note. Oblimin-rotated minimum-residual pattern loadings of the within-condition item correlations (psych::fa(), n as in the parallel analysis above) at two and three factors. The registered code built only the one-factor candidate and the parallel-analysis k (3); the two-factor pattern was never fitted in production. Factor: the factor each item is assigned to (its largest absolute loading); an item qualifies when its largest absolute loading is at least .30 and exceeds its next loading by at least .20. Two factors: item 9 on E2 does not qualify (loading .424, gap to its next loading .038). Three factors: item 9 on E2 does not qualify (loading .513, gap to its next loading .142).

Table S2.7

Alternative measurement structures, ten items: the registered pattern screen of the two- and three-factor candidates

Candidate	Items per factor	Qualifying items	Factor correlations	Screen
Two-factor	E1: 1, 6, 7; E2: 2, 3, 4, 5, 8, 9, 10	E1: 3; E2: 6	E1–E2 .447	passes
Three-factor	E1: 1, 6, 7; E2: 2, 4, 5, 8, 9; E3: 3, 10	E1: 3; E2: 4; E3: 2	E1–E2 .414; E1–E3 .158; E2–E3 .341	fails: fewer than three qualifying indicators on a factor (E3)

Note. The registered pattern screen: an item qualifies when its largest absolute loading is at least .30 and exceeds its next loading by at least .20; each factor needs at least 3 qualifying items; every factor correlation must be below .90 in absolute value; no factor may be empty. The three-factor assignment is the one Pilot 2's pooled three-factor structure found.

Table S2.8

Alternative measurement structures, ten items: the two-factor candidate through the registered invariance steps

Step	Numerical requirements	Robust CFI	Robust RMSEA [90% CI]	SRMR	BIC
Configural	failed (2 attempts): SEM failed convergence/ admissibility; lavaan: some	—	—	—	—

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Step	Numerical requirements	Robust CFI	Robust RMSEA [90% CI]	SRMR	BIC
	estimated ov variances are negative				
Metric	met	.820	.134 [.117, .150]	.117	929.5
Scalar	met	.808	.128 [.112, .143]	.124	749.4

Note. Invariance tests of the two-factor pattern, with the highest-loading item of each factor as its marker. The candidate is inadmissible (at least one invariance fit failed numerical requirements), so the analysis evaluates no criteria and records no scalar BIC. The registered selection over the registered candidates (one and three factors): none; over one, two and three factors: none. The ten-item mean stands.

Table S2.9

Alternative measurement structures, ten items: the configural fits read under lavaan's default convergence check (diagnostic, not registered)

Model	Fit read	Robust CFI	Robust RMSEA [90% CI]	SRMR	Registered criterion met
One-factor, Configural	the pipeline's kept fit (inadmissible in the pipeline)	.739	.174 [.156, .191]	.117	no
One-factor, Metric	the pipeline's admissible fit	.714	.165 [.150, .180]	.149	no
One-factor, Scalar	the pipeline's admissible fit	.691	.158 [.144, .172]	.162	no
Two-factor, Configural	the pipeline's kept fit (inadmissible in the pipeline)	.831	.142 [.123, .160]	.099	no
Two-factor, Metric	the pipeline's admissible fit	.820	.134 [.117, .150]	.117	no
Two-factor, Scalar	the pipeline's admissible fit	.808	.128 [.112, .143]	.124	no

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Model	Fit read	Robust CFI	Robust RMSEA [90% CI]	SRMR	Registered criterion met

Note. Diagnostic (a), not registered: each candidate's configural fit, which failed the numerical requirements of the analysis, read under lavaan's default convergence check. The metric and scalar rows are the admissible fits. The registered criteria are read on these indices for comparison only; the rule is unchanged. One-factor configural: lavaan's optimizer converged and the solution is admissible; max |gradient| 0.000391449, within lavaan's default tolerance of 0.001. In the convergence checks its projected gradient, 0.000391449, is above the threshold of 1e-04, the only clause that fails. Two-factor configural: lavaan's optimizer converged and the solution is inadmissible (lavaan's post.check fails); max |gradient| 4.95167e-05, within lavaan's default tolerance of 0.001. In the convergence checks it fails before the gradient clause (SEM failed convergence/ admissibility; Nonpositive measurement variance); negative variance: item 6 in Improper disposal, No information: −0.0562 (SE 0.2113).

Table S2.10

Alternative measurement structures, eight items (documented deviation): parallel analysis

Factor	Observed eigenvalue	Simulated eigenvalue		Observed exceeds the 95th percentile	Factor indicated
		Mean	95th percentile		
1	3.279	0.556	1.036	yes	yes
2	0.748	0.154	0.203	yes	yes
3	0.124	0.096	0.138	no	no
4	−0.072	0.046	0.080	no	no
5	−0.083	0.001	0.032	no	no
6	−0.191	−0.044	−0.015	no	no
7	−0.259	−0.096	−0.060	no	no
8	−0.267	−0.158	−0.109	no	no

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Factor	Observed eigenvalue	Simulated eigenvalue		Observed exceeds the 95th percentile	Factor indicated
		Mean	95th percentile		

Note. Items 1, 2, 4, 5, 6, 7, 8, 9. Parallel analysis of the within-condition correlations of the eight items (n = 392: 398 complete responses minus the six condition means), 1,000 normal-reference datasets, the 95th percentile, seed 9152605. Factors indicated: 2. psych::fa.parallel() counts factors against the 95th percentile of the simulated eigenvalues and returns their mean; both are shown, as in the M01 parallel-analysis table above. For the ten items both give 3 factors; for these eight items the mean would give 3 and the 95th percentile gives 2. The run first reproduced the registered ten-item decision (12 of 12 checks against the production measurement object and the ten-item run, all passed); the ten-item functions were evaluated from their own code with only the item set changed.

Table S2.11

Alternative measurement structures, eight items (documented deviation): the candidates through the registered loop

Candidate	Built by	Items per factor	Screen	All three fits admissible	Registered criteria met	Scalar BIC	Selected
One-factor	registered loop (always considered)	E1: 1, 2, 4, 5, 6, 7, 8, 9	does not apply	no	not evaluated	—	no
Two-factor	registered loop (indicated)	E1: 1, 6, 7; E2: 2, 4, 5, 8, 9	passes	no	not evaluated	—	no
Three-factor	added (not indicated)	E1: 1, 6, 7; E2: 2, 4, 5; E3: 8, 9	fails (E3)	not fitted	not evaluated	—	no

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Candidate	Built by	Items per factor	Screen	All three fits admissible	Registered criteria met	Scalar BIC	Selected

Note. The registered candidate loop (one factor, plus the parallel-analysis k if it is two or three), and every k from two to three the loop did not build, through the registered candidate, invariance, and selection steps. With 8 items no three-factor pattern can pass: three factors need 9 qualifying items. Reasons: One-factor, at least one invariance fit failed numerical requirements; Two-factor, at least one invariance fit failed numerical requirements; Three-factor, fewer than three qualifying indicators on a factor. Selection over the registered loop's candidates: none; over one, two and three factors: none.

Table S2.12

Alternative measurement structures, eight items (documented deviation): the one-, two- and three-factor pattern loadings

	One factor	Two factors			Three factors			
Item	E1	E1	E2	Factor	E1	E2	E3	Factor
1	.36	.61	−.07	E1	.66	.04	−.10	E1
2	.72	−.08	.85	E2	−.03	.76	.10	E2
4	.70	−.05	.81	E2	.05	.88	−.08	E2
5	.74	.02	.78	E2	−.02	.56	.29	E2
6	.47	.66	.03	E1	.64	.06	.03	E1
7	.50	.73	.01	E1	.64	−.05	.17	E1
8	.78	.21	.65	E2	−.01	.20	.67	E3
9	.71	.38	.45	E2 (not qualifying)	.12	−.04	.74	E3

Note. Oblimin-rotated minimum-residual pattern loadings of the eight items at two and three factors. The one-factor loadings are descriptive: the one-factor pattern is built without an EFA (marker item 1), and no screen applies to it. Two factors: item 9 on E2 does not qualify (loading .452, gap .071). Factor correlations: two factors .443; three factors E1–E2 .303, E1–E3 .540, E2–E3 .678.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Table S2.13

Alternative measurement structures, eight items (documented deviation): the admissible candidates through the registered invariance steps

Model	Numerical requirements	Robust CFI	Robust RMSEA [90% CI]	SRMR	BIC
One-factor, Configural	failed (2 attempts): SEM projected gradient is too large: 0.000741189	—	—	—	—
One-factor, Metric	met	.778	.172 [.151, .192]	.152	750.7
One-factor, Scalar	met	.748	.165 [.147, .184]	.169	617.3
Two-factor, Configural	failed (2 attempts): SEM failed convergence/ admissibility	—	—	—	—
Two-factor, Metric	met	.904	.117 [.093, .141]	.101	633.7
Two-factor, Scalar	met	.886	.116 [.094, .137]	.112	508.6

Note. Invariance tests of each admissible eight-item pattern used the MLR fits with FIML, the six conditions as groups, 2,000 and then 10,000 iterations, and the numerical requirements of the analysis (including the projected gradient below 1e-4). A candidate whose fits do not all meet them is inadmissible, and the analysis evaluates no criteria for it. The fits that failed are read under lavaan's default check in the next table.

Table S2.14

Alternative measurement structures, eight items (documented deviation): the fits that failed the numerical requirements, read under lavaan's default check (diagnostic, not registered)

Model	Fit read	Robust CFI	Robust RMSEA [90% CI]	SRMR	Registered criterion met
One-factor, Configural	the pipeline's kept fit (inadmissible in the pipeline)	.728	.216 [.193, .239]	.129	no
One-factor, Metric	the pipeline's admissible fit	.778	.172 [.151, .192]	.152	yes
One-factor, Scalar	the pipeline's admissible fit	.748	.165 [.147, .184]	.169	no

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Model	Fit read	Robust CFI	Robust RMSEA [90% CI]	SRMR	Registered criterion met
Two-factor, Configural	the pipeline's kept fit (inadmissible in the pipeline)	.917	.123 [.095, .150]	.077	no
Two-factor, Metric	the pipeline's admissible fit	.904	.117 [.093, .141]	.101	no
Two-factor, Scalar	the pipeline's admissible fit	.886	.116 [.094, .137]	.112	no

Note. Diagnostic, not registered (as diagnostic (a) above): every eight-item candidate with a fit that failed the numerical requirements, each step read from the fit the analysis kept, and the registered criteria read on these indices for comparison only; the rule is unchanged. One-factor configural: lavaan's optimizer converged and the solution is admissible; max |gradient| 0.000741189, within lavaan's default tolerance of 0.001. In the convergence checks its projected gradient, 0.000741189, is above the threshold of 1e-04, the only clause that fails. Two-factor configural: lavaan's optimizer converged and the solution is inadmissible (lavaan's post.check fails); max |gradient| 5.79052e-05, within lavaan's default tolerance of 0.001. In the convergence checks it fails before the gradient clause (SEM failed convergence/admissibility; Nonpositive measurement variance); negative variance: item 6 in Improper disposal, No information: −0.0280 (SE 0.1380).

S3. Manipulation checks and descriptive statistics

Table S3.1

Missing responses, skewness and kurtosis of the continuous modeled measures, primary sample

Measure	n	Missing (%)	Skewness	Kurtosis
Pregnancy-evidence likelihood	398	0.0	0.15	−0.86
Financial-crime evidence likelihood	398	0.0	1.18	0.06
Nothing-incriminating likelihood	398	0.0	−0.04	−1.27
Consequence severity	398	0.0	−0.79	0.02
Foreseeability	398	0.0	0.00	−0.95
Evidence relevance (ten-item mean)	398	0.0	−0.84	0.51
Decision quality	398	0.0	−0.12	−1.31
Detective blame	398	0.0	−0.03	−1.53
Consequences for the detective	398	0.0	0.66	−0.84
Wrongness of the detective's decision	398	0.0	0.03	−1.46
Suspect blame	398	0.0	0.08	−1.34
Probable-cause confidence	398	0.0	−1.10	1.22
Signed probable-cause confidence	398	0.0	−0.05	−1.83
Required certainty, keyword warrant	398	0.0	−1.02	0.47
Required certainty, text-message warrant	398	0.0	−0.99	0.74
Required certainty, home search	398	0.0	−0.97	0.62
Abortion attitudes (total)	398	0.0	0.47	−0.99
Support for punishment	398	0.0	0.18	−0.98
Hostile sexism	398	0.0	0.55	−0.73
Benevolent sexism	398	0.0	−0.18	−0.84

Note. The supplement registers these descriptions and keeps the registered estimators whatever they show. All three are computed with psych::skew() and psych::kurtosi() (type 3; kurtosis is excess kurtosis). Missing = participants without a response over the primary sample.

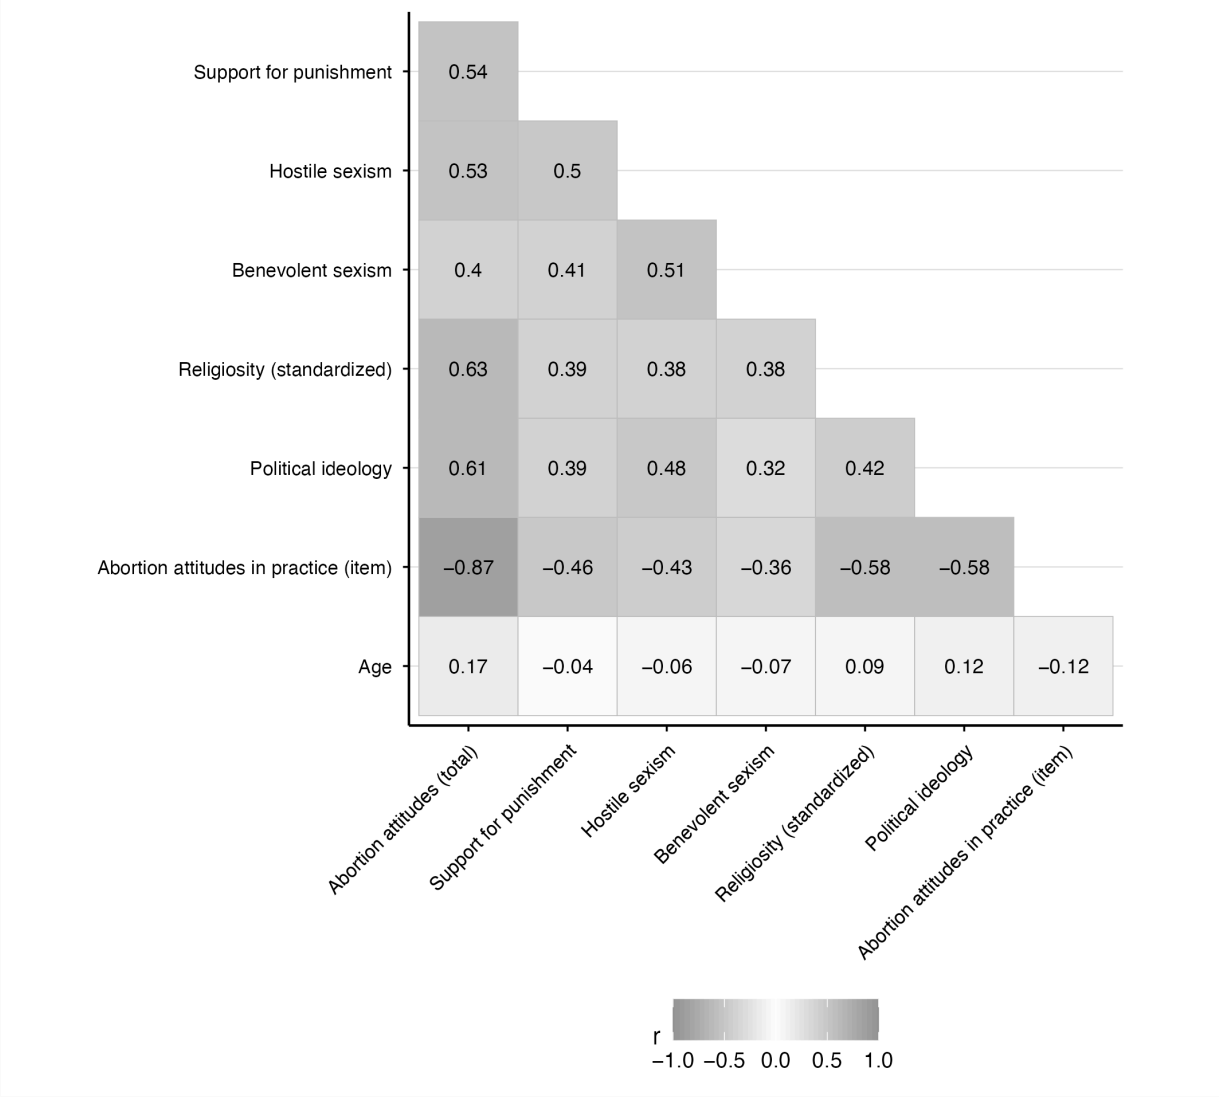
Figure S3.1

Correlations among the attitude and background measures



Note. Pearson correlations in the primary sample, computed from the same data as the table above. Religiosity is the mean of the standardized items. Darker shading marks a larger correlation, and the printed coefficient gives its sign. The figure is descriptive.

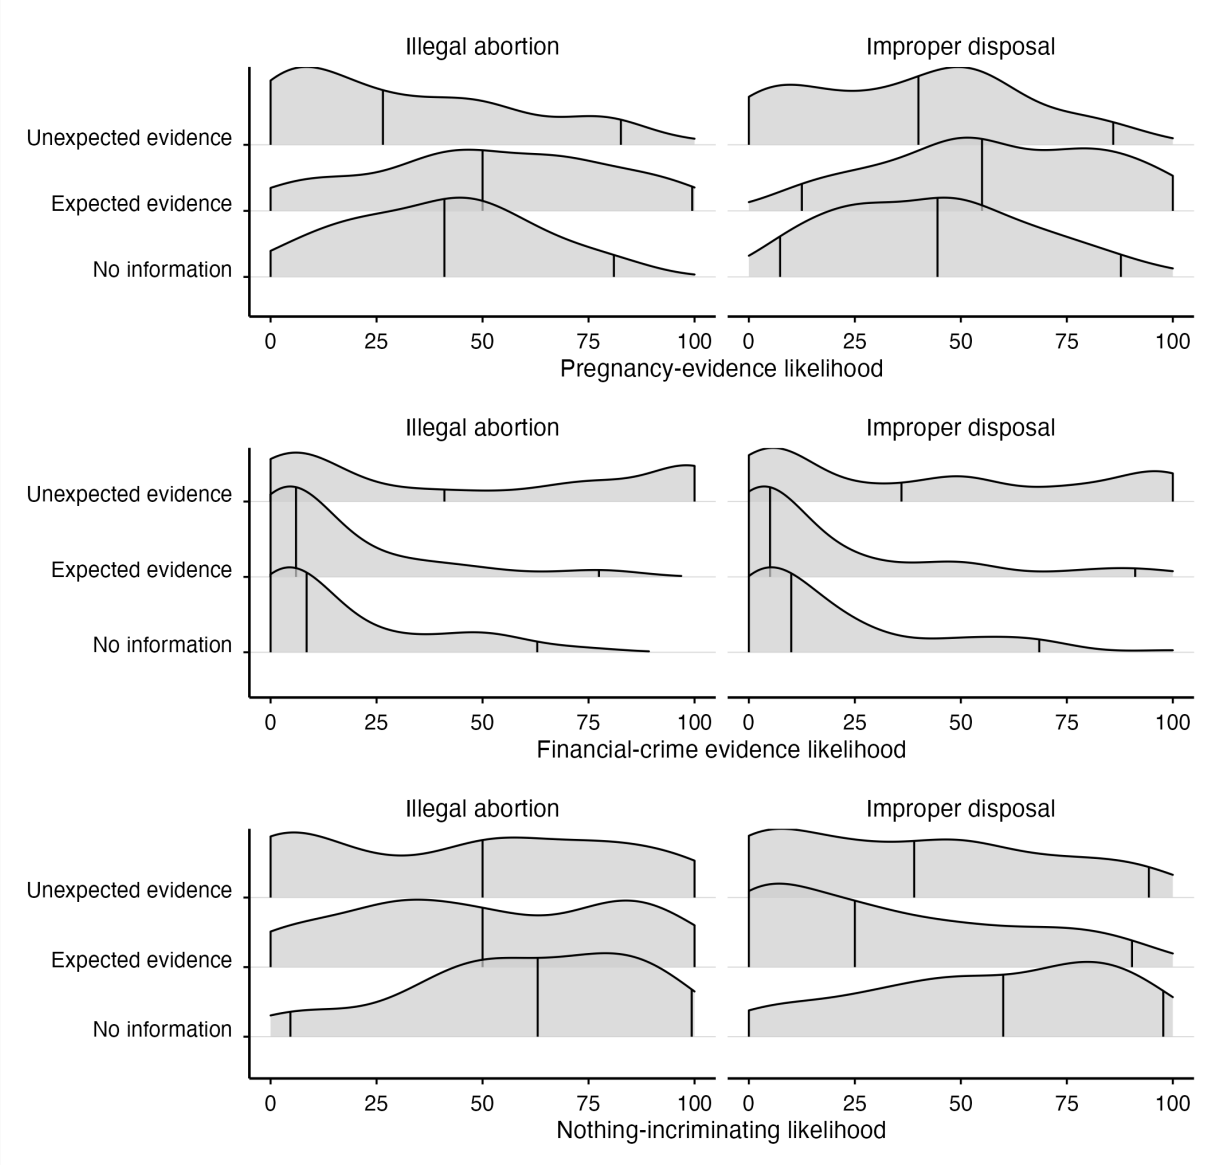
Figure S3.2

Likelihood judgments by condition



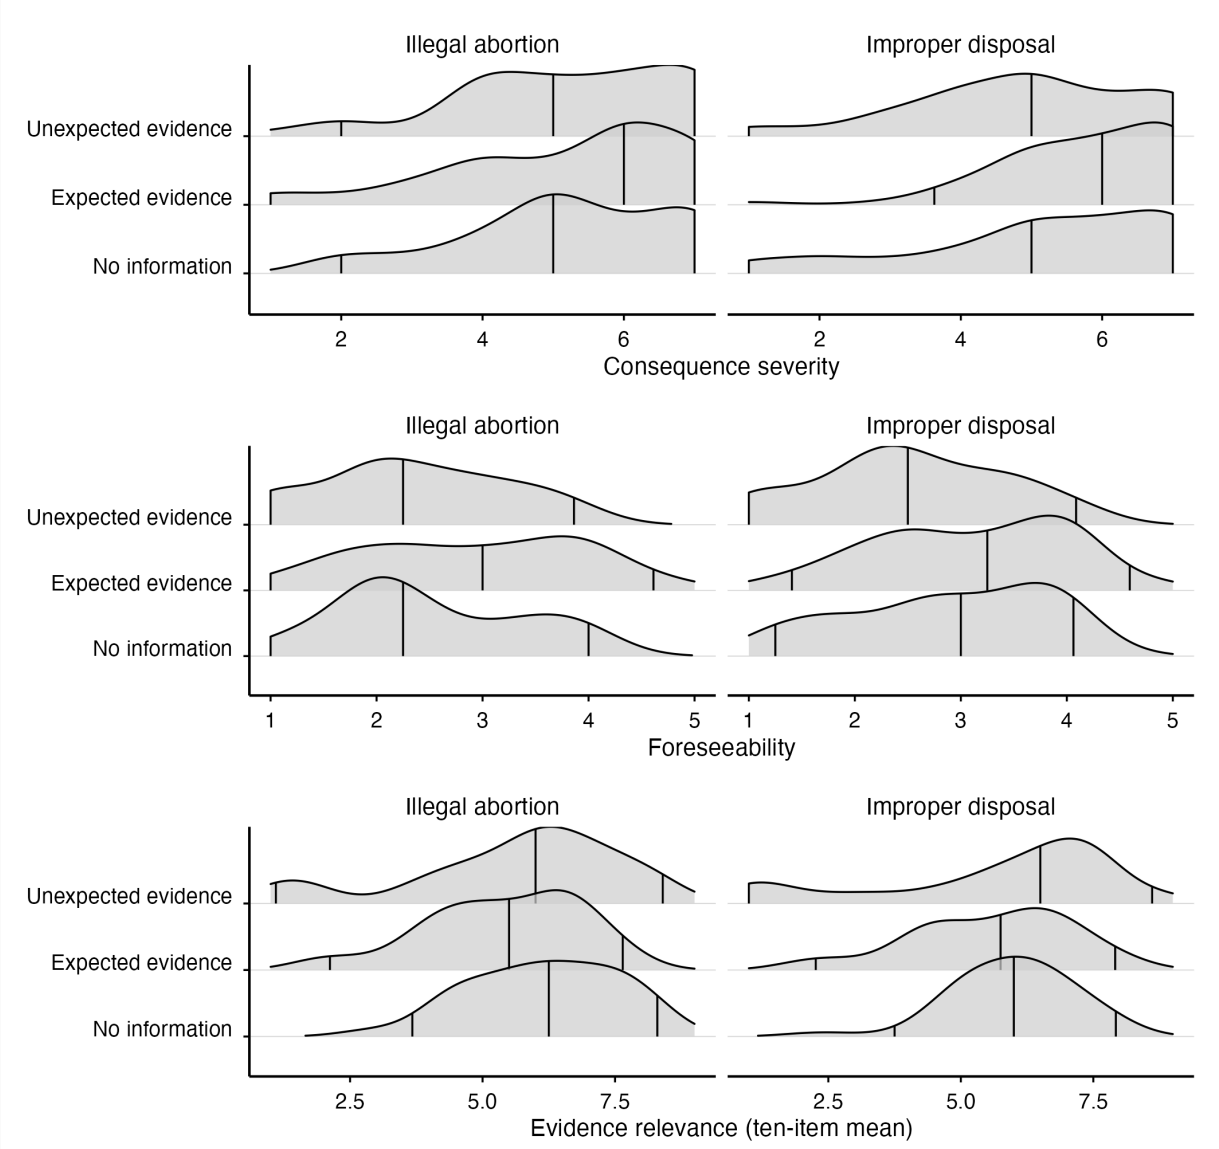
Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (0 to 100 for each of the three likelihood ratings). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with

© 2026 Emma Marshall · CC BY-NC-SA 4.0

unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Figure S3.3

Consequence severity, foreseeability, and evidence relevance by condition



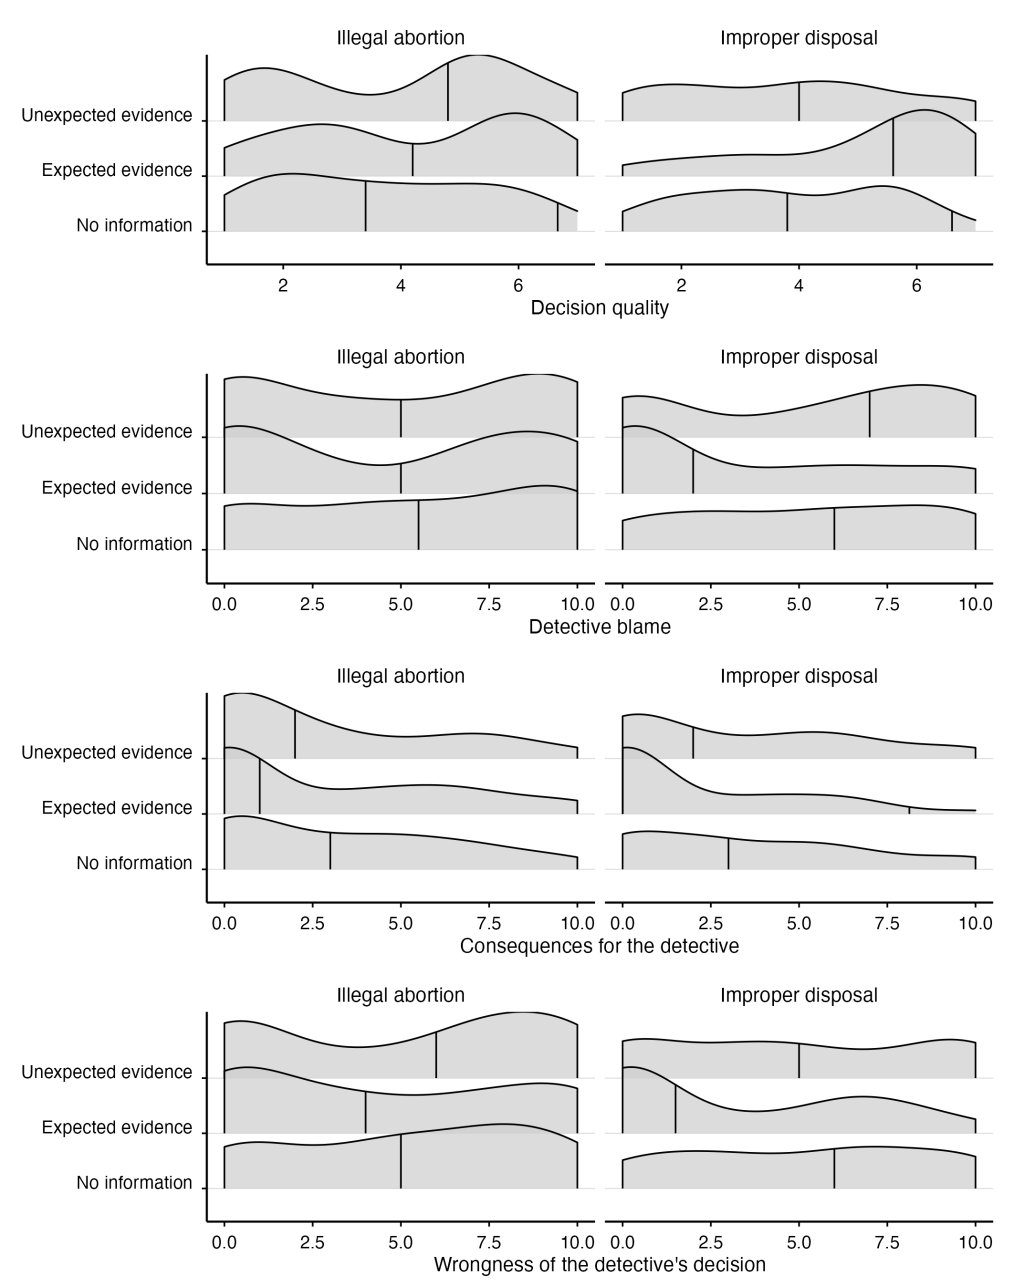
Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (1 to 7 for consequence severity, 1 to 5 for foreseeability, and 1 to 9 for evidence relevance). Evidence

© 2026 Emma Marshall · CC BY-NC-SA 4.0

relevance is the mean of the 10 relevance ratings. The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Figure S3.4

Judgments of the detective by condition

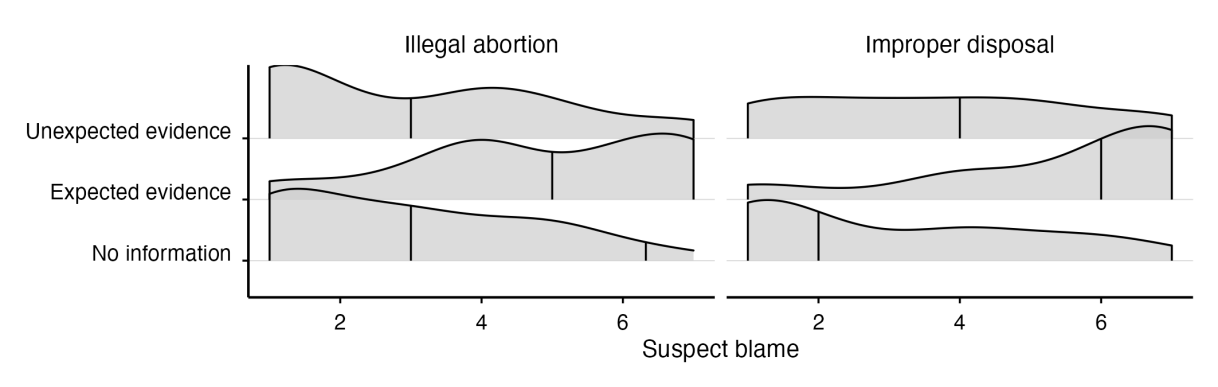


© 2026 Emma Marshall · CC BY-NC-SA 4.0

Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (1 to 7 for decision quality and 0 to 10 for detective blame, the consequences for the detective, and the wrongness of the decision). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Figure S3.5

Suspect blame by condition



Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (1 to 7). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

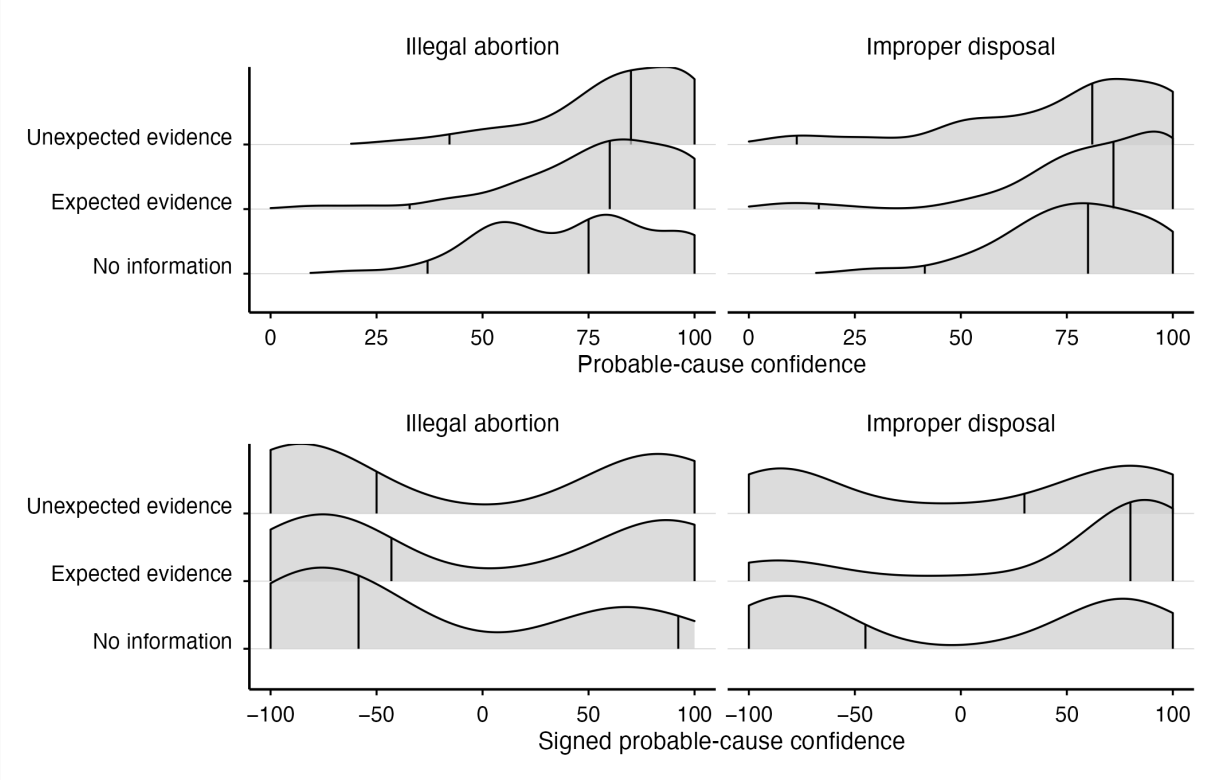
Figure S3.6

Confidence in the probable cause ruling by condition



Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (0 to 100 for probable cause confidence and −100 to 100 for signed probable cause confidence). Signed confidence is the confidence rating when the participant found probable cause and its negative when the participant did not. The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

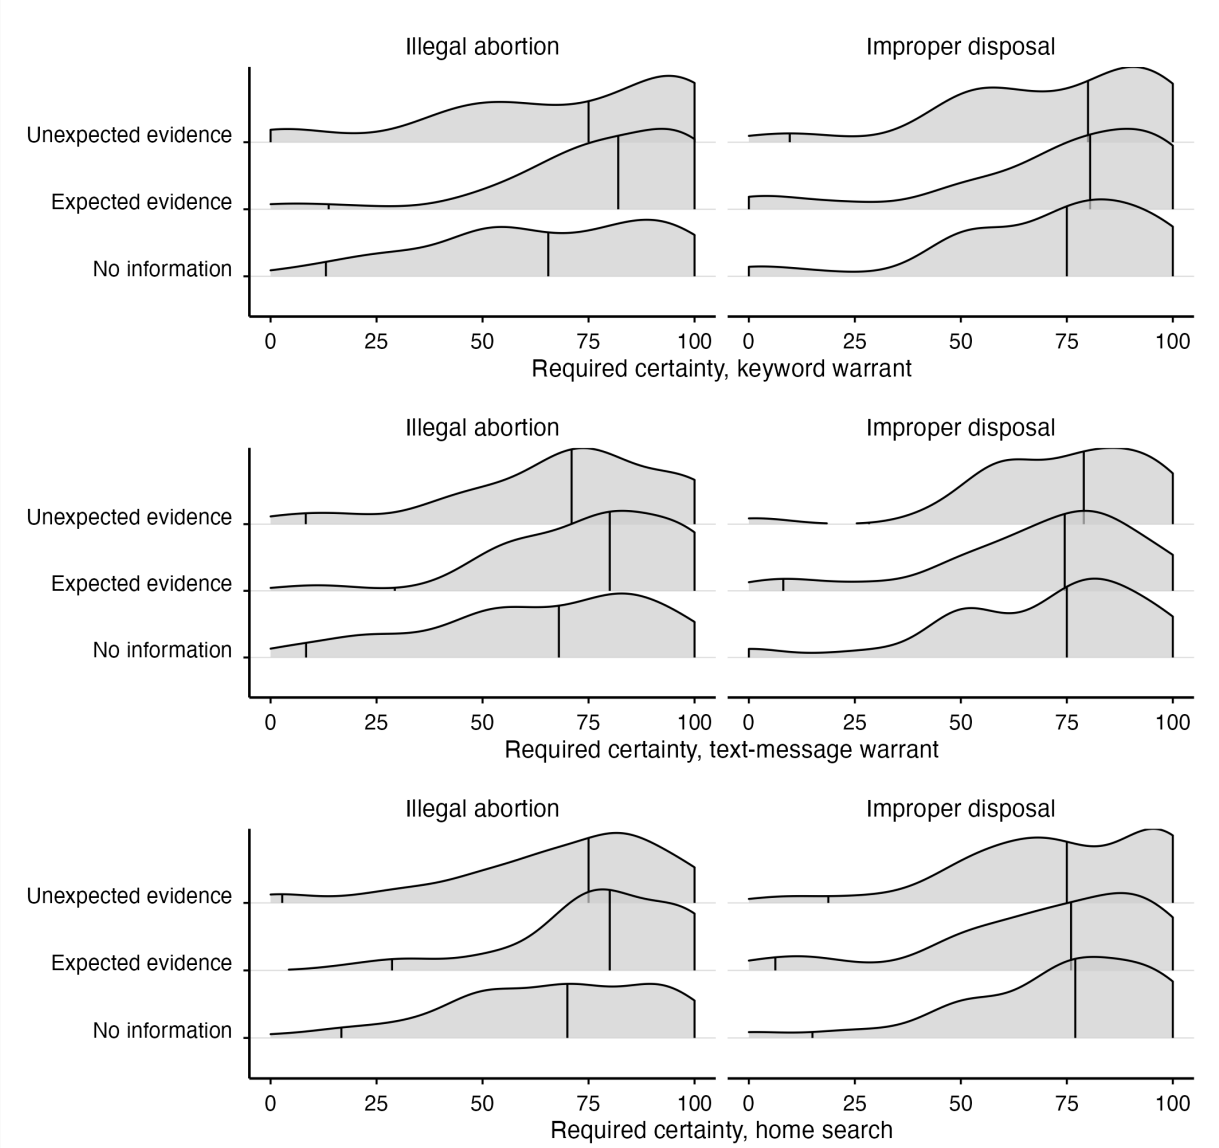
Figure S3.7

Certainty required for the three search targets by condition



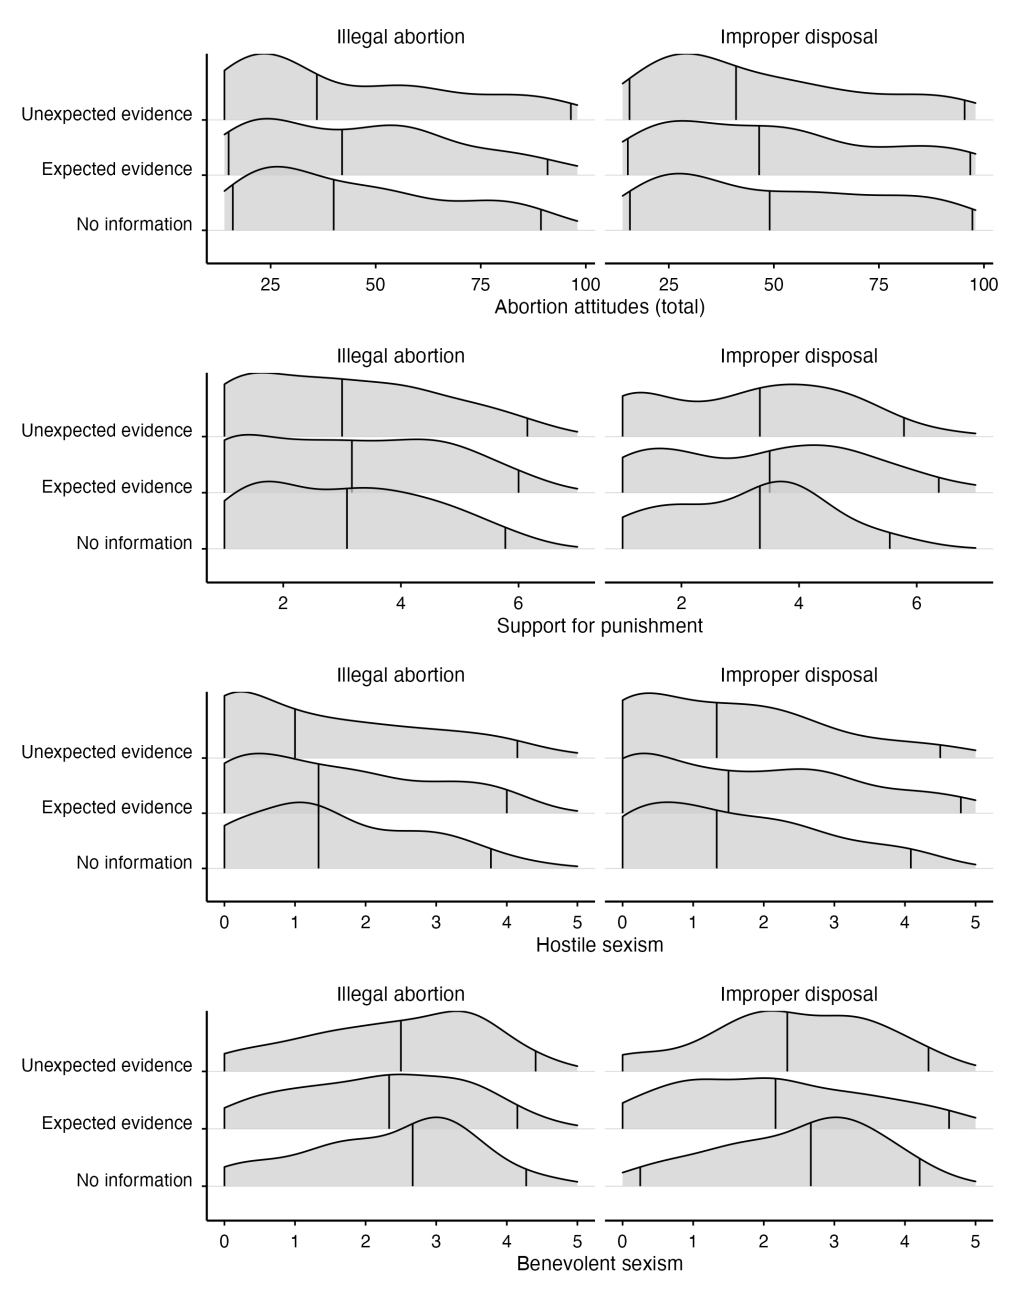
Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (0 to 100 for the certainty required for the keyword warrant, the text-message warrant, and the home search). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected

© 2026 Emma Marshall · CC BY-NC-SA 4.0

evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Figure S3.8

Attitude measures by outcome condition and legal context



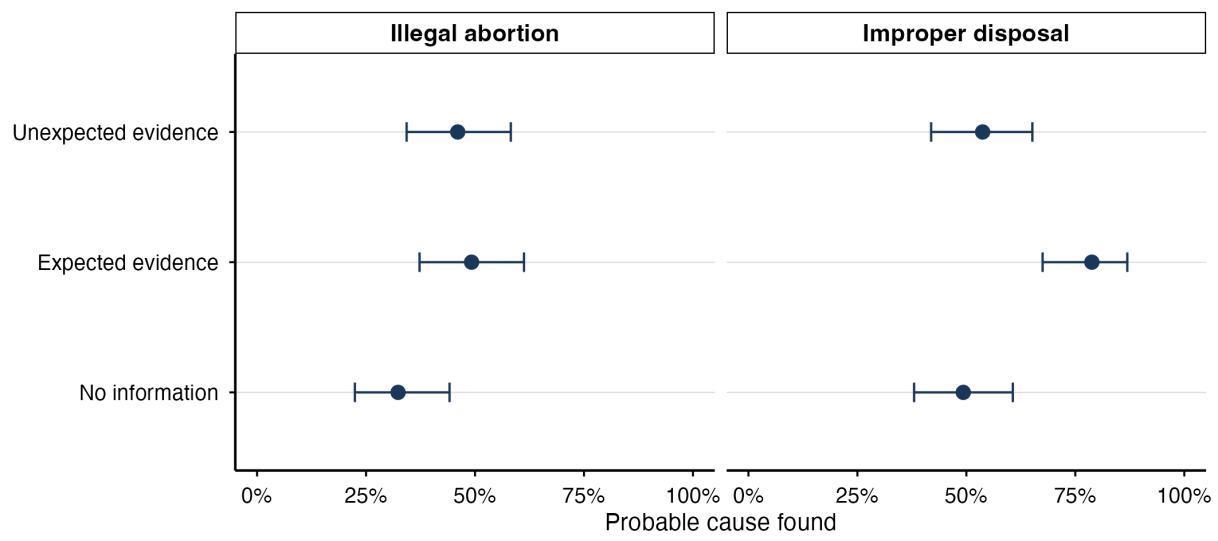
Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is

© 2026 Emma Marshall · CC BY-NC-SA 4.0

the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (14 to 98 for abortion attitudes, 1 to 7 for support for punishment, and 0 to 5 for hostile and benevolent sexism). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Figure S3.9

Proportion of participants finding probable cause, by condition, with Wilson score 95% intervals



Note. Points show the proportion of participants who answered the original ruling and found probable cause. Bars are Wilson score 95% intervals. The figure is descriptive. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Table S3.6

Relevance ratings of the ten evidence items by condition, primary sample: M (SD)

Item	Illegal abortion, No information	Illegal abortion, Expected evidence	Illegal abortion, Unexpected evidence	Improper disposal, No information	Improper disposal, Expected evidence	Improper disposal, Unexpected evidence	Total	n
Relevance, item 1	5.37 (2.71)	6.43 (2.37)	5.17 (2.77)	5.32 (2.41)	6.74 (2.59)	5.43 (3.09)	5.74 (2.72)	398

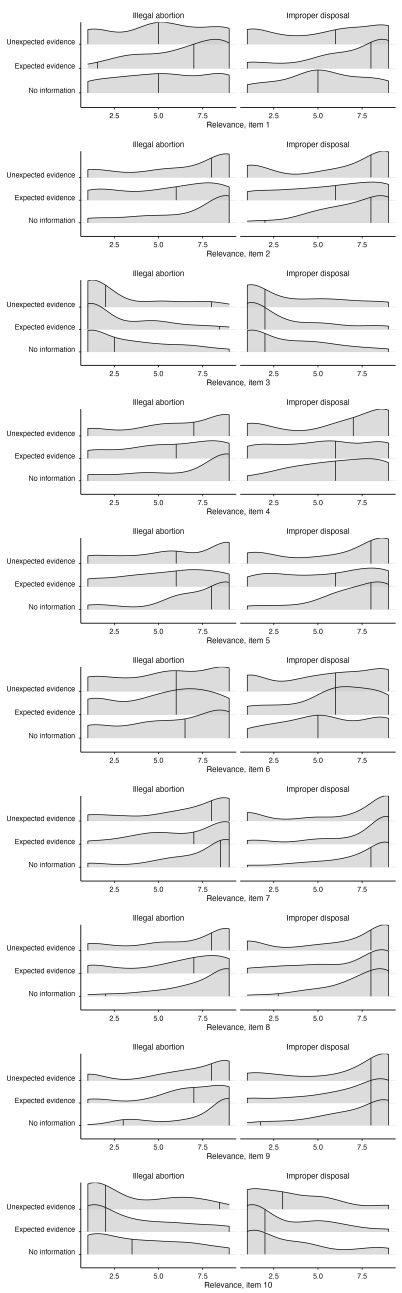
Figure S3.10

Relevance ratings of the ten evidence items by outcome condition and legal context



Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (1 to 9 for each

© 2026 Emma Marshall · CC BY-NC-SA 4.0

of the ten relevance items). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Table S3.8

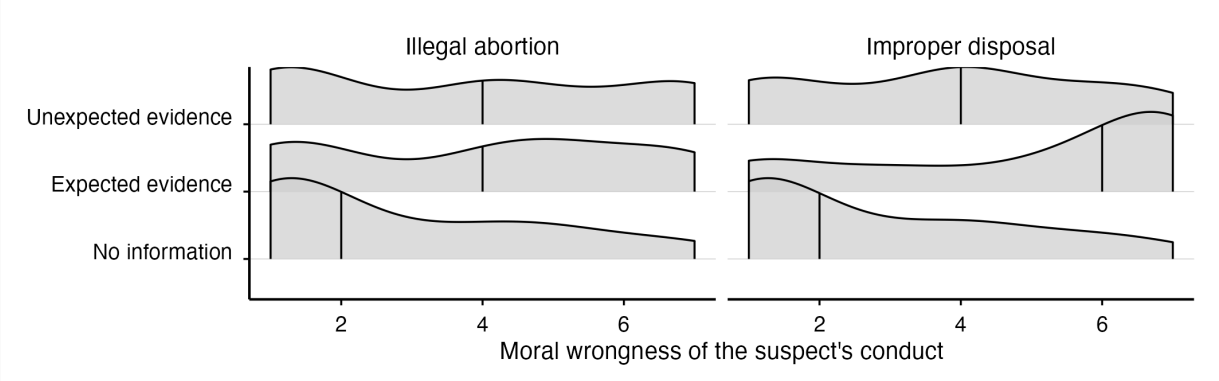
Moral wrongness of the suspect's conduct by condition, primary sample

Condition	n	Missing	M	SD	Mdn	Range
Illegal abortion, No information	68	0	2.88	2.01	2.0	1 to 7
Illegal abortion, Expected evidence	63	0	3.97	2.19	4.0	1 to 7
Illegal abortion, Unexpected evidence	63	0	3.78	2.30	4.0	1 to 7
Improper disposal, No information	71	0	2.86	1.97	2.0	1 to 7
Improper disposal, Expected evidence	66	0	4.88	2.26	6.0	1 to 7
Improper disposal, Unexpected evidence	67	0	3.81	2.03	4.0	1 to 7
Total	398	0	3.68	2.22	4.0	1 to 7

Note. Ratings run from 1 to 7. Reported descriptively, without a significance decision, as registered.

Figure S3.11

Moral wrongness of the suspect's conduct by outcome condition and legal context



Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (1 to 7). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no

information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Table S3.9

Legal-context check in the primary sample: the registered rule, by legal context

Legal context	n	Assigned statute	Other statute	Cannot recall	Blank	Rate (%)	95% CI	At or above threshold
Illegal abortion	194	168	10	16	0	86.6	[81.1, 90.7]	yes
Improper disposal	204	171	25	8	0	83.8	[78.2, 88.2]	yes

Note. Primary sample. n per legal context from the eligibility records of the data preparation. Rate = participants choosing the assigned statute / n; another statute, "I cannot recall which statute was cited" and a blank response do not identify it. 95% CI = Wilson score interval for the proportion, without continuity correction. Registered threshold: 60%, read from the quoted supplement sentence. Primary estimates: grouped.

Table S3.10

Legal-context check: participants choosing the statute their warrant cited

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
Primary	Illegal abortion	194	168	26	16	0	86.6	[81.1, 90.7]
	Improper disposal	204	171	33	8	0	83.8	[78.2, 88.2]
	Ab, no information	68	57	11	7	0	83.8	[73.3, 90.7]
	Ab, expected evidence	63	59	4	2	0	93.7	[84.8, 97.5]
	Ab, unexpected evidence	63	52	11	7	0	82.5	[71.4, 90.0]
	Di, no information	71	60	11	4	0	84.5	[74.3, 91.1]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
	Di, expected evidence	66	55	11	2	0	83.3	[72.6, 90.4]
	Di, unexpected evidence	67	56	11	2	0	83.6	[72.9, 90.6]
	All conditions	398	339	59	24	0	85.2	[81.3, 88.3]
Survey responses	Illegal abortion	212	181	31	17	0	85.4	[80.0, 89.5]
	Improper disposal	230	190	40	11	0	82.6	[77.2, 87.0]
	Ab, no information	75	60	15	8	0	80.0	[69.6, 87.5]
	Ab, expected evidence	69	65	4	2	0	94.2	[86.0, 97.7]
	Ab, unexpected evidence	68	56	12	7	0	82.4	[71.6, 89.6]
	Di, no information	78	65	13	4	0	83.3	[73.5, 90.0]
	Di, expected evidence	77	63	14	4	0	81.8	[71.8, 88.8]
	Di, unexpected evidence	75	62	13	3	0	82.7	[72.6, 89.6]
	All conditions	442	371	71	28	0	83.9	[80.2, 87.1]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI

Note. n per condition from the eligibility records of the data preparation. Passed, did not pass, and blank come from the recorded checks; a participant who did not pass answered with any other option. Rate = passed / n. 95% CI = Wilson score interval for the proportion, without continuity correction. Ab = illegal abortion; Di = improper disposal of human remains; expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. “Of which, cannot recall” counts the answer “I cannot recall which statute was cited”; it does not identify the statute.

Table S3.11

Outcome check: participants identifying what the search revealed

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
Primary	No information	139	94	45	17	0	67.6	[59.5, 74.8]
	Expected evidence	129	116	13	2	0	89.9	[83.5, 94.0]
	Unexpected evidence	130	107	23	5	0	82.3	[74.8, 87.9]

S4. Full results of the manuscript's models

Table S4.1

Global fit of the four saved versions of the H1 model

Model	χ^2	df	p	CFI	RMSEA	RMSEA 90% CI	SRMR
Registered model	23.31	26	.616	1.000	.000	[.000, .049]	.027
Without attitudes	16.07	10	.098	.978	.056	[.000, .103]	.038
Pooled contexts	31.15	30	.408	.999	.012	[.000, .056]	.034
Pooled contexts, without attitudes	24.11	14	.044	.963	.060	[.010, .100]	.050

Note. Scaled (Satorra–Bentler) chi-square with its p; robust CFI; robust RMSEA with its 90% interval; SRMR, as registered for the over-identified model. Global fit is reported and changes no model. RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).

Table S4.2

The registered H1 equality test: the registered model against the model with every H1 path free by legal context

Model	χ^2	df	p	CFI	RMSEA	SRMR
Registered model (shared paths)	23.31	26	.616	1.000	.000 [.000, .049]	.027
Every H1 path free by legal context	8.41	4	.078	.994	.074 [.000, .146]	.018
Scaled difference	14.88	22	.867	—	—	—

Note. Satorra–Bentler (2010) scaled chi-square difference on the registered df (22 here, the analysis's expected df 22). Not rejected: the registered common-path model stands; no sensitivity products are reported. RMSEA with its 90% interval in brackets; CFI and RMSEA robust. Support for H1a–H1d is read from the registered model either way. RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level). When this comparison was estimated, lavaan warned that the covariance matrix of the parameter estimates did not appear to be positive definite (smallest eigenvalue = −1.825270e-18, below zero). This may be a symptom that the model is not identified.

Predictor	Illegal abortion			Improper disposal			Equal across contexts
	b (SE)	95% CI	p	b (SE)	95% CI	p	
Evidence relevance with consequence severity	0.225 (0.183)	[−0.134, 0.585]	.220	−0.196 (0.169)	[−0.526, 0.135]	.246	No
Pregnancy-evidence likelihood with foreseeability	7.886 (1.712)	[4.531, 11.241]	< .001	8.478 (1.527)	[5.486, 11.471]	< .001	No

Note. Unstandardized estimates in the original units with robust (Huber–White) standard errors, normal Wald 95% intervals and two-sided p. Paths marked equal across contexts are one shared parameter. Standardized estimates are in the supplementary standardized table. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S4.4

Variance explained in each equation of the registered H1 model, by legal context

Equation	Illegal abortion	Improper disposal
Evidence relevance	.072	.038
Consequence severity	.029	.088
Pregnancy-evidence likelihood	.163	.185
Foreseeability	.098	.108

Note. R^2 of each endogenous variable from the fitted model. R^2 does not depend on the fitting scale. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S4.5

Indirect effects without the attitudes (registered companion), by legal context

Pathway	Letter	Estimate	95% CI	Predicted
Illegal abortion				
Expected evidence → evidence relevance → pregnancy-evidence likelihood	H1a	−1.800	[−3.636, −0.471]	Positive
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	H1b	−1.372	[−3.264, −0.028]	Negative
Expected evidence → consequence severity → foreseeability	H1c	−0.001	[−0.023, 0.019]	Positive
Unexpected evidence → consequence severity → foreseeability	H1d	0.0000	[−0.020, 0.019]	Positive
Improper disposal				
Expected evidence → evidence relevance → pregnancy-evidence likelihood	H1a	−0.944	[−2.267, 0.093]	Positive
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	H1b	−0.785	[−2.470, 0.640]	Negative
Expected evidence → consequence severity → foreseeability	H1c	0.014	[−0.030, 0.058]	Positive
Unexpected evidence → consequence severity → foreseeability	H1d	−0.004	[−0.034, 0.015]	Positive

Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-outcome paths, in pregnancy-evidence likelihood points or foreseeability scale points per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Global fit: scaled $\chi^2(10) = 16.07$, $p = .098$; robust CFI = .978; robust RMSEA = .056, 90% CI [.000, .103]; SRMR = .038. Reported beside the registered model; decisions are read from the registered model only. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Pathway	Letter	Estimate	95% CI	Predicted

Note. The pooled estimates: every path constrained to be equal across the two legal contexts (the registered secondary analysis when both contexts pass the legal-context rule). Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-outcome paths, in pregnancy-evidence likelihood points or foreseeability scale points per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Global fit, pooled contexts: scaled $\chi^2(30) = 31.15$, $p = .408$; robust CFI = .999; robust RMSEA = .012, 90% CI [.000, .056]; SRMR = .034. Global fit, pooled contexts, without attitudes: scaled $\chi^2(14) = 24.11$, $p = .044$; robust CFI = .963; robust RMSEA = .060, 90% CI [.010, .100]; SRMR = .050. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

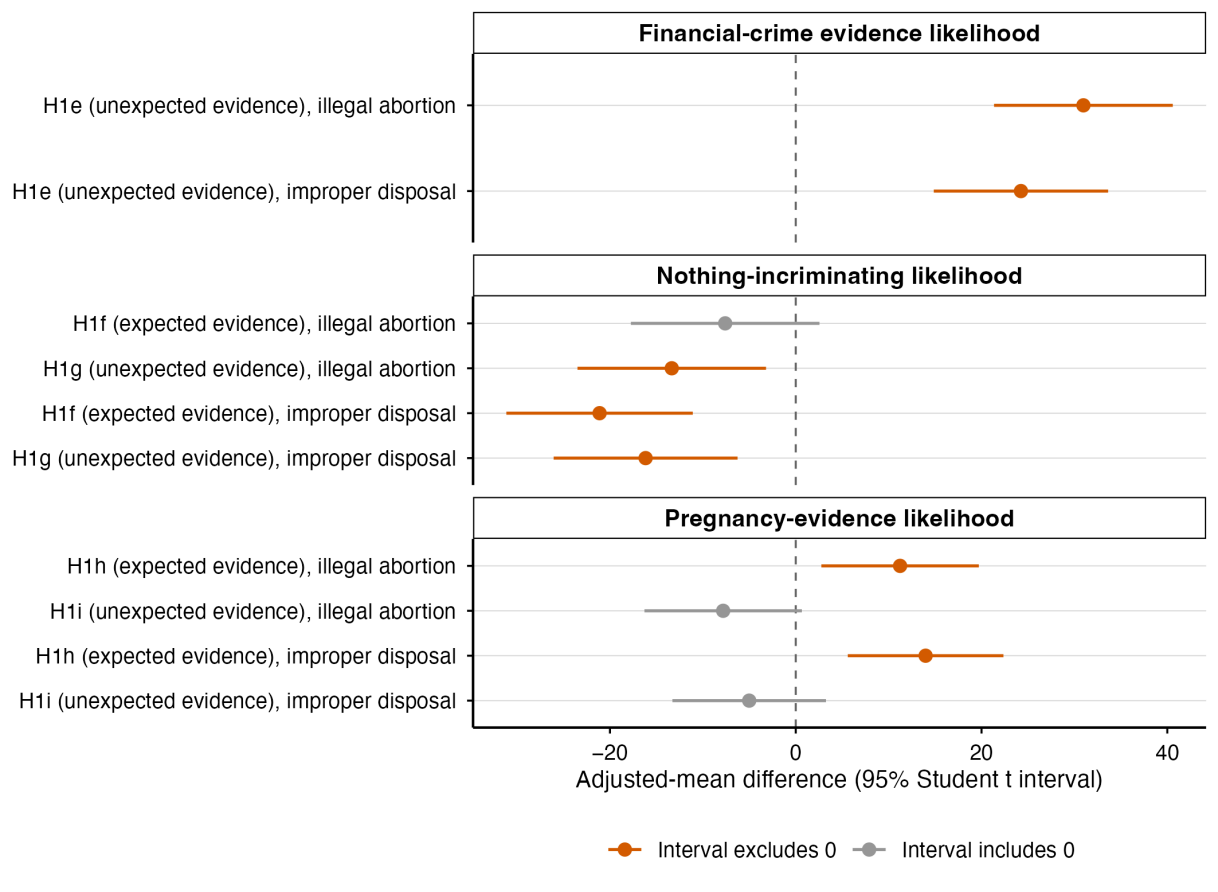
Figure S4.1

Registered comparisons of the likelihood judgments with their Student t intervals



Note. I adjusted the primary-sample mean differences for the four attitudes. I used no information as the reference, except for rows comparing expected with unexpected evidence. Color marks intervals that exclude zero; the two-sided 95% Student *t* intervals use residual degrees of freedom. The table gives the decisions. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S4.7

Condition means of the six judgments from the saved models, with and without the attitudes

Judgment	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
With the four attitudes (registered)						
Financial-crime evidence likelihood	16.72 [10.05, 23.40]	14.77 [7.83, 21.71]	47.69 [40.75, 54.64]	18.14 [11.58, 24.70]	16.82 [9.98, 23.66]	42.38 [35.66, 49.11]
Nothing-incriminating likelihood	58.46 [51.42, 65.49]	50.86 [43.54, 58.18]	45.11 [37.78, 52.44]	55.84 [48.92, 62.76]	34.72 [27.50, 41.94]	39.67 [32.58, 46.76]
Pregnancy-evidence likelihood	40.30 [34.42, 46.17]	51.53 [45.42, 57.64]	32.48 [26.37, 38.60]	43.33 [37.55, 49.10]	57.31 [51.28, 63.33]	38.31 [32.39, 44.24]
Abortion-evidence likelihood	28.89 [22.45, 35.33]	54.68 [47.99, 61.38]	31.38 [24.68, 38.09]	32.80 [26.47, 39.13]	50.77 [44.17, 57.37]	31.75 [25.26, 38.24]
Disposal-evidence likelihood	51.70 [44.58, 58.82]	48.38 [40.98, 55.78]	33.58 [26.17, 41.00]	53.85 [46.85, 60.85]	63.84 [56.54, 71.14]	44.88 [37.70, 52.05]
Foreseeability	2.533 [2.316, 2.750]	2.926 [2.700, 3.152]	2.369 [2.143, 2.595]	2.884 [2.671, 3.098]	3.077 [2.854, 3.300]	2.512 [2.293, 2.731]
Without attitudes						
Financial-crime evidence likelihood	16.04 [9.16, 22.92]	14.52 [7.38, 21.67]	46.90 [39.76, 54.05]	18.27 [11.53, 25.00]	18.30 [11.32, 25.29]	42.45 [35.52, 49.38]
Nothing-incriminating likelihood	59.35 [52.03, 66.68]	51.16 [43.55, 58.77]	45.87 [38.27, 53.48]	55.77 [48.61, 62.94]	33.12 [25.69, 40.55]	39.40 [32.03, 46.78]
Pregnancy-evidence likelihood	39.69 [33.64, 45.74]	51.27 [44.98, 57.56]	31.95 [25.66, 38.24]	43.40 [37.48, 49.33]	58.41 [52.26, 64.55]	38.51 [32.41, 44.61]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Judgment	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
Abortion-evidence likelihood	28.12 [21.45, 34.79]	54.35 [47.42, 61.28]	30.46 [23.53, 37.39]	33.20 [26.67, 39.72]	52.32 [45.55, 59.09]	31.78 [25.06, 38.49]
Disposal-evidence likelihood	51.26 [44.02, 58.51]	48.19 [40.66, 55.72]	33.44 [25.92, 40.97]	53.61 [46.51, 60.70]	64.50 [57.15, 71.85]	45.24 [37.94, 52.54]
Foreseeability	2.518 [2.297, 2.739]	2.921 [2.691, 3.150]	2.357 [2.128, 2.587]	2.880 [2.664, 3.097]	3.106 [2.882, 3.330]	2.519 [2.296, 2.741]

Note. Each entry is the condition mean with its two-sided 95% Student t interval, from the saved model's coefficients and covariance on its residual degrees of freedom: with the attitudes, the mean at the attitude means of the participants in the model; without them, the condition mean. Each saved comparison is a difference of these means. Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Source	F	df1	df2	p	Partial η²	90% CI

Note. Analysis of Covariance (ANCOVA) with the four attitudes as covariates. Type-II F-tests. Partial η² = partial eta-squared (η^2_p) with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. The bands with the attitudes are the analyses of covariance. The bands without attitudes are the analyses of variance without covariates. The registered tests are the comparisons, not these F tests.

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI
likelihood: expected evidence – no information								
Nothing-incriminating likelihood: unexpected evidence – no information	H1g	Negative	−16.37	5.23	−3.13	392	.002	[−26.66, −6.09]
Pregnancy-evidence likelihood: expected evidence – no information	H1h	Positive	15.01	4.34	3.46	392	< .001	[6.47, 23.54]
Pregnancy-evidence likelihood: unexpected evidence – no information	H1i	Negative	−4.89	4.32	−1.13	392	.258	[−13.40, 3.61]

Note. Differences of adjusted condition means with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of each model; no adjustment for multiple comparisons. The models carry the six conditions and no covariate. Reported beside the registered models; decisions are read from the models with attitudes only. A row without a letter is a comparison that no letter reads with a direction: the expected-evidence comparison on financial-crime evidence likelihood is the quantity of the E2h equivalence test. Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI

Note. The pooled comparisons: each comparison averaged over the two legal contexts with equal weights, with the Outcome × Legal Context interaction kept in the model (the registered secondary analysis when both contexts pass the legal-context rule). Differences of adjusted condition means with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of each model; no adjustment for multiple comparisons. The letter is the one the comparison would serve under the legal-context rule; no decision is read from this set. Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S4.12

Global fit of the four saved versions of the H2a–H2b model

Model	χ^2	df	p	CFI	RMSEA	RMSEA 90% CI	SRMR
Registered model	26.85	28	.527	1.000	.000	[.000, .052]	.026
Without attitudes	20.47	12	.059	.985	.059	[.000, .102]	.037
Pooled contexts	41.63	42	.487	1.000	.000	[.000, .048]	.034
Pooled contexts, without attitudes	32.82	22	.064	.980	.051	[.000, .085]	.048

Note. Scaled (Satorra–Bentler) chi-square with its p; robust CFI; robust RMSEA with its 90% interval; SRMR, as registered for the over-identified model. Global fit is reported and changes no model. RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level). The E6 analysis estimates the same model; its saved global fit is identical for the registered model and the model without attitudes.

Coefficient	Letter	b	SE	z	p	95% CI	Predicted

Note. Unstandardized coefficients of the decision-quality equation, in decision-quality points (1–7 scale) per point of pregnancy-evidence likelihood (0–100 scale) or of foreseeability (1–5 scale), with robust (Huber–White) standard errors, z tests and two-sided normal Wald 95% intervals, in the original units. No resampling. Global fit, without attitudes: scaled $\chi^2(12) = 20.47$, $p = .059$; robust CFI = .985; robust RMSEA = .059, 90% CI [.000, .102]; SRMR = .037. Global fit, pooled contexts: scaled $\chi^2(42) = 41.63$, $p = .487$; robust CFI = 1.000; robust RMSEA = .000, 90% CI [.000, .048]; SRMR = .034. Global fit, pooled contexts, without attitudes: scaled $\chi^2(22) = 32.82$, $p = .064$; robust CFI = .980; robust RMSEA = .051, 90% CI [.000, .085]; SRMR = .048. The pooled set: every path constrained to be equal across the two legal contexts (the registered secondary analysis when both contexts pass the legal-context rule). Decisions are read from the registered model of the primary set only. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S4.16

Omnibus tests of the three context-averaged outcome means of each judgment, with and without the attitudes

Judgment	F	df	p	Partial η^2	90% CI
With the four attitudes (registered)					
Decision quality	6.79	2, 388	.001	.034	[.01, 1.00]
Detective blame	2.99	2, 388	.052	.015	[.002, 1.00]
Consequences for the detective	3.20	2, 388	.042	.016	[.002, 1.00]
Wrongness of the detective's decision	4.34	2, 388	.014	.022	[.01, 1.00]
Without attitudes					
Decision quality	7.45	2, 392	< .001	.037	[.01, 1.00]
Detective blame	3.84	2, 392	.022	.019	[.004, 1.00]
Consequences for the detective	3.51	2, 392	.031	.018	[.003, 1.00]
Wrongness of the detective's decision	5.15	2, 392	.006	.026	[.01, 1.00]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Judgment	F	df	p	Partial η²	90% CI

Note. The registered omnibus test: an F test with two numerator degrees of freedom and the model's residual degrees of freedom that the three outcome means, each averaged over the legal contexts with equal weights, are equal, recomputed from the fitted model. It is reported but does not decide any letter; support rests on the planned comparisons. Partial η² with its 90% interval as the effectsize package gives it for the saved F (one-sided, so the upper limit is 1).

Table S4.17

Condition means of the four judgments from the saved models, with and without the attitudes

	Illegal abortion			Improper disposal		
Judgment	**No information**	**Expected evidence**	**Unexpected evidence**	**No information**	**Expected evidence**	**Unexpected evidence**
With the four attitudes (registered)						
Decision quality	3.75 [3.36, 4.14]	4.19 [3.78, 4.59]	4.06 [3.66, 4.47]	3.85 [3.47, 4.24]	4.82 [4.42, 5.22]	3.79 [3.40, 4.18]

Judgment	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
Consequences for the detective	3.43 [2.66, 4.19]	3.05 [2.25, 3.84]	2.95 [2.16, 3.75]	3.68 [2.93, 4.42]	2.00 [1.22, 2.78]	3.43 [2.66, 4.20]
Wrongness of the detective's decision	5.26 [4.40, 6.13]	4.49 [3.60, 5.39]	5.14 [4.25, 6.04]	5.18 [4.34, 6.03]	3.29 [2.41, 4.16]	4.87 [4.00, 5.73]

Note. Each entry is the condition mean with its two-sided 95% Student t interval, from the saved model's coefficients and covariance on its residual degrees of freedom: with the attitudes, the mean at the attitude means of the participants in the model; without them, the condition mean. Each saved comparison is a difference of these means, averaged over the legal contexts or taken between them. Decision quality is in points on the 1–7 scale; detective blame, deserved consequences and wrongness are in points on their 0–10 scales. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Legal context × outcome information	0.91	2	392	.405	.005	[.000, 1.000]

Note. Analysis of Covariance (ANCOVA) with the four attitudes as covariates. Type-II F-tests. Partial η^2 = partial eta-squared (η^2_p) with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. The bands with the attitudes are the analyses of covariance. The bands without attitudes are the analyses of variance without covariates. These Type-II F tests are a standard decomposition, not the registered tests: the registered omnibus outcome test, which weights the legal contexts equally, is in the omnibus table, and the registered comparisons are in the tables above.

Table S4.19

Attitude slopes of the four analyses of covariance

Attitude	b	SE	t	df	p	95% CI
Decision quality						
Abortion attitudes	0.011	0.004	2.50	388	.013	[0.002, 0.019]
Support for punishment	0.409	0.068	6.04	388	< .001	[0.276, 0.543]
Hostile sexism	0.103	0.080	1.28	388	.201	[−0.055, 0.260]

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI
unexpected evidence								

Note. Differences of adjusted outcome means with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of each model; no adjustment for multiple comparisons. The models carry the six conditions and no covariate. Reported beside the registered models; decisions are read from the models with attitudes only. The abortion-minus-disposal rows are the interaction comparisons, reported without a verdict. Decision quality is in points on the 1–7 scale; detective blame, deserved consequences and wrongness are in points on their 0–10 scales. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S4.21

Condition means of blame from the saved models, with and without the attitudes

Model	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
With the four attitudes (registered)	3.02 [2.60, 3.44]	4.83 [4.39, 5.27]	3.18 [2.75, 3.62]	3.03 [2.62, 3.45]	5.20 [4.77, 5.63]	3.71 [3.29, 4.13]
Without attitudes	2.94 [2.48, 3.40]	4.79 [4.32, 5.27]	3.10 [2.62, 3.57]	3.07 [2.62, 3.52]	5.35 [4.88, 5.82]	3.72 [3.25, 4.18]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Model	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence

Note. Each entry is the condition mean of blame with its two-sided 95% Student t interval, from the saved model's coefficients and covariance on its residual degrees of freedom: with the attitudes, the mean at the attitude means of the participants in the model; without them, the condition mean. Each saved comparison is an equal-weight average of differences of these means. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S4.22

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI

Note. Differences of adjusted outcome-condition means, each the equal-weight average of the two within-context differences, with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of the model; no adjustment for multiple comparisons. The model carries the six conditions and no covariate. Reported beside the registered model; decisions are read from the model with attitudes only. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S4.25

Global fit of the four saved versions of the serial pathway model

Model	χ^2	df	p	CFI	RMSEA	RMSEA 90% CI	SRMR
Registered model	33.71	30	.293	.996	.025	[.000, .062]	.031
Without attitudes	25.36	14	.031	.973	.066	[.021, .106]	.046
Pooled contexts	50.56	42	.171	.991	.032	[.000, .061]	.040
Pooled contexts, without attitudes	39.13	22	.014	.960	.064	[.029, .096]	.059

Note. Scaled (Yuan–Bentler) chi-square with its p; robust CFI; robust RMSEA with its 90% interval; SRMR, for the over-identified model. Global fit is reported and changes no model. RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).

Table S4.26

Unstandardized path estimates of the registered serial pathway model, by legal context

	Illegal abortion			Improper disposal

Pathway	Letter	Estimate	95% CI	Predicted	Decision

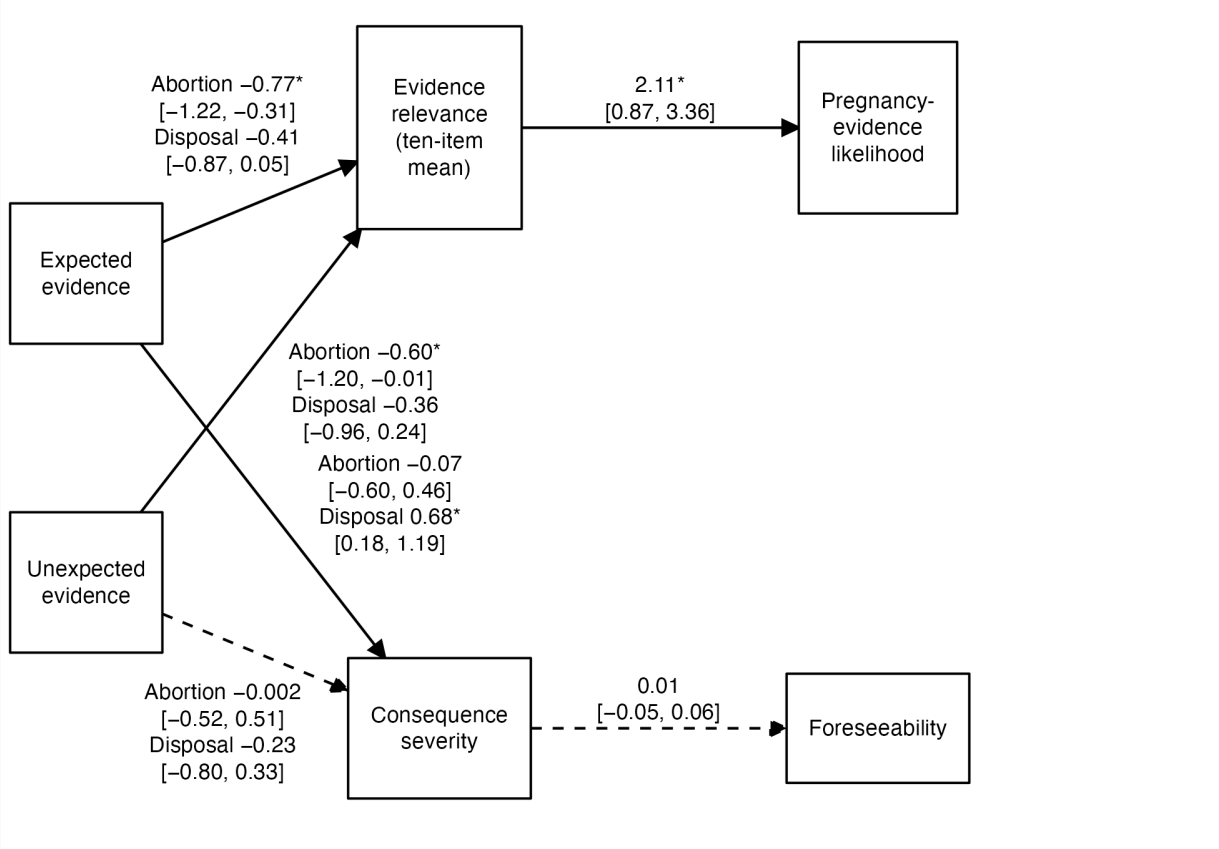
Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-outcome paths, in pregnancy-evidence likelihood points or foreseeability scale points per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Global fit of the registered model: scaled $\chi^2(26) = 23.31$, $p = .616$; robust CFI = 1.000; robust RMSEA = .000, 90% CI [.000, .049]; SRMR = .027. A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Figure S5.1

Fitted hindsight-pathway chains



© 2026 Emma Marshall · CC BY-NC-SA 4.0

Note. Registered H1 model in the primary sample. Ten-item mean relevance mediates the likelihood route (H1a–H1b), and consequence severity mediates the foreseeability route (H1c–H1d). Path labels give unstandardized estimates in the original units, with robust (Huber–White) Wald 95% intervals. Outcome-to-mediator paths have separate Abortion (illegal abortion) and Disposal (improper disposal) estimates; relevance-to-likelihood and severity-to-foreseeability paths share estimates across contexts. Dashed paths have intervals containing zero for the shared estimate or for both context estimates. The tables report the indirect effects and omitted direct outcome paths, attitude slopes, and disturbance covariances. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S5.2

Legal-context comparisons of the hindsight pathways in the registered H1 model

Quantity	Letter	Estimate	95% CI	Test	p
Outcome-to-mediator coefficients, abortion minus disposal (robust Wald)					
Expected evidence → evidence relevance	E1a	−0.355 (0.332)	[−1.005, 0.295]	$\chi^2(1) = 1.14$	.285
Unexpected evidence → evidence relevance	E1a	−0.245 (0.427)	[−1.081, 0.592]	$\chi^2(1) = 0.33$	.568
Expected evidence → consequence severity	E1b	−0.749 (0.375)	[−1.484, −0.014]	$\chi^2(1) = 4.17$	.041
Unexpected evidence → consequence severity	E1b	0.232 (0.388)	[−0.529, 0.992]	$\chi^2(1) = 0.35$	.552
Indirect effects, abortion minus disposal (percentile bootstrap)					
Expected evidence → evidence relevance → pregnancy-evidence likelihood	E1a	−0.750	[−2.634, 0.568]	—	—
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	E1a	−0.517	[−2.640, 1.327]	—	—
Expected evidence → consequence severity → foreseeability	E1b	−0.006	[−0.056, 0.046]	—	—

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Quantity	Letter	Estimate	95% CI	Test	p
Unexpected evidence → consequence severity → foreseeability	E1b	0.002	[−0.022, 0.035]	—	—
Joint equality tests (scaled chi-square difference)					
Relevance paths jointly	E1a	—	—	$\chi^2(2) = 0.82$	.664
Severity paths jointly	E1b	—	—	$\chi^2(2) = 7.25$	.027
Both sets of outcome-to-mediator paths	E1b	—	—	$\chi^2(4) = 7.93$	.094

Note. Differences are abortion minus disposal. Coefficient differences: unstandardized, with robust (Huber–White) SE and normal Wald 95% intervals, and the one-df scaled chi-square difference test of their equality. Indirect-effect differences: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Joint tests: Satorra–Bentler (2010) scaled chi-square differences of the models with the named paths equal across contexts. Reported without a verdict (no registered decision rule). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S5.3

Legal-context comparisons of the hindsight pathways without the attitudes

Quantity	Letter	Estimate	95% CI	Test	p
Outcome-to-mediator coefficients, abortion minus disposal (robust Wald)					
Expected evidence → evidence relevance	E1a	−0.365 (0.335)	[−1.023, 0.292]	$\chi^2(1) = 1.18$	.277
Unexpected evidence → evidence relevance	E1a	−0.251 (0.430)	[−1.094, 0.592]	$\chi^2(1) = 0.34$	.561
Expected evidence → consequence severity	E1b	−0.768 (0.379)	[−1.511, −0.026]	$\chi^2(1) = 4.29$	.038
Unexpected evidence → consequence severity	E1b	0.233 (0.391)	[−0.534, 1.000]	$\chi^2(1) = 0.35$	.554
Indirect effects, abortion minus disposal (percentile bootstrap)

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI	Decision
expected evidence									

Note. Differences of adjusted condition means with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of each model; no adjustment for multiple comparisons. Each model holds the four attitudes at their means. Predicted = the registered sign of the difference. A letter is supported in a legal context when its interval lies on the predicted side of zero. Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S5.5

Comparisons of abortion-evidence likelihood, disposal-evidence likelihood and foreseeability without the attitudes

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI
Illegal abortion								
Abortion-evidence likelihood: expected evidence – no information	E2a	Positive	26.23	4.89	5.36	392	< .001	[16.62, 35.85]
Abortion-evidence likelihood: unexpected evidence – no information	E2b	Negative	2.34	4.89	0.48	392	.632	[−7.27, 11.96]
Disposal-evidence likelihood: expected evidence – no information	E2c	Positive	−3.07	5.31	−0.58	392	.563	[−13.52, 7.37]

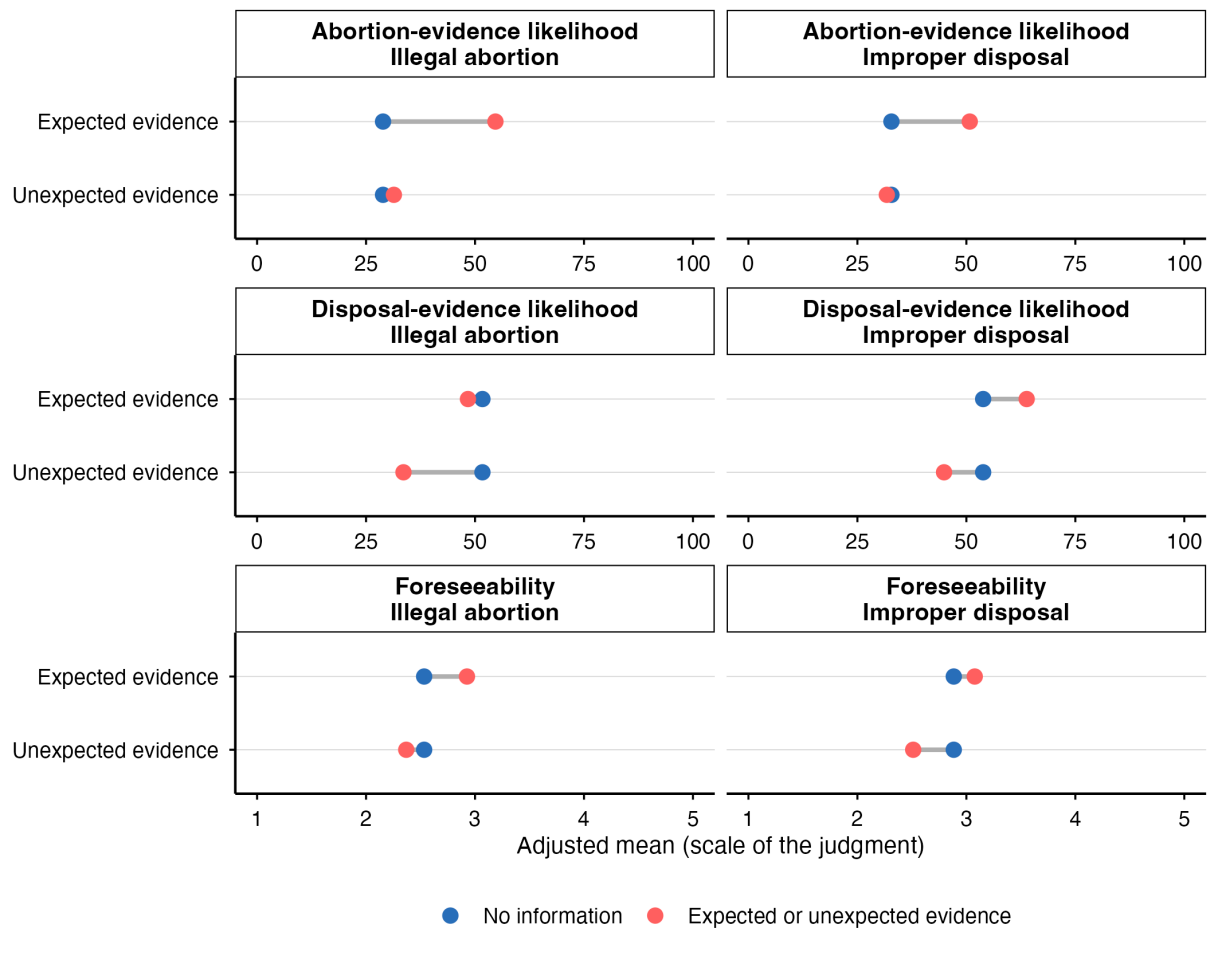
Figure S5.2

Adjusted mean abortion-evidence likelihood, disposal-evidence likelihood and foreseeability: no information against expected and unexpected evidence, by legal context



Note. Adjusted means of likelihood (0–100) and foreseeability (1–5), with the four attitudes at their primary-sample means. Each line connects the no-information mean to the expected- or unexpected-evidence mean, using a separate scale for each panel. I plotted the means without intervals; Student *t* intervals for their comparisons appear in the table. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

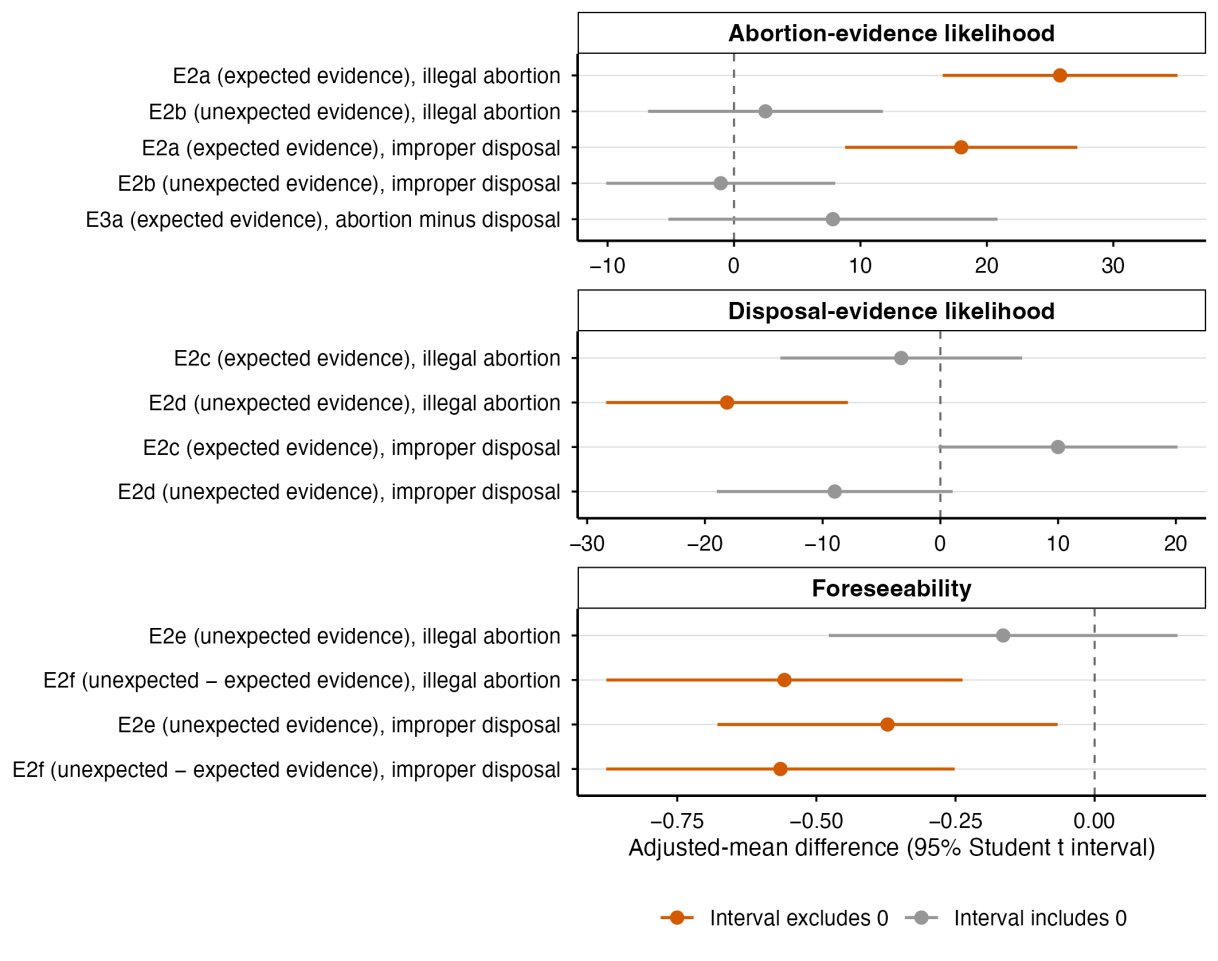
Figure S5.3

Exploratory comparisons of abortion-evidence likelihood, disposal-evidence likelihood and foreseeability with their Student t intervals



Note. Points are the adjusted mean differences in the primary sample, with the four attitudes as covariates. The bars give two-sided 95% Student *t* intervals with the residual degrees of freedom. The panels use separate scales. Comparisons use no information as the reference unless the row names two kinds of evidence, and color marks whether the interval excludes zero. The tables give the decisions. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Bounds	Difference	SE	df	90% CI	p, lower bound	p, upper bound	Reading	Decision

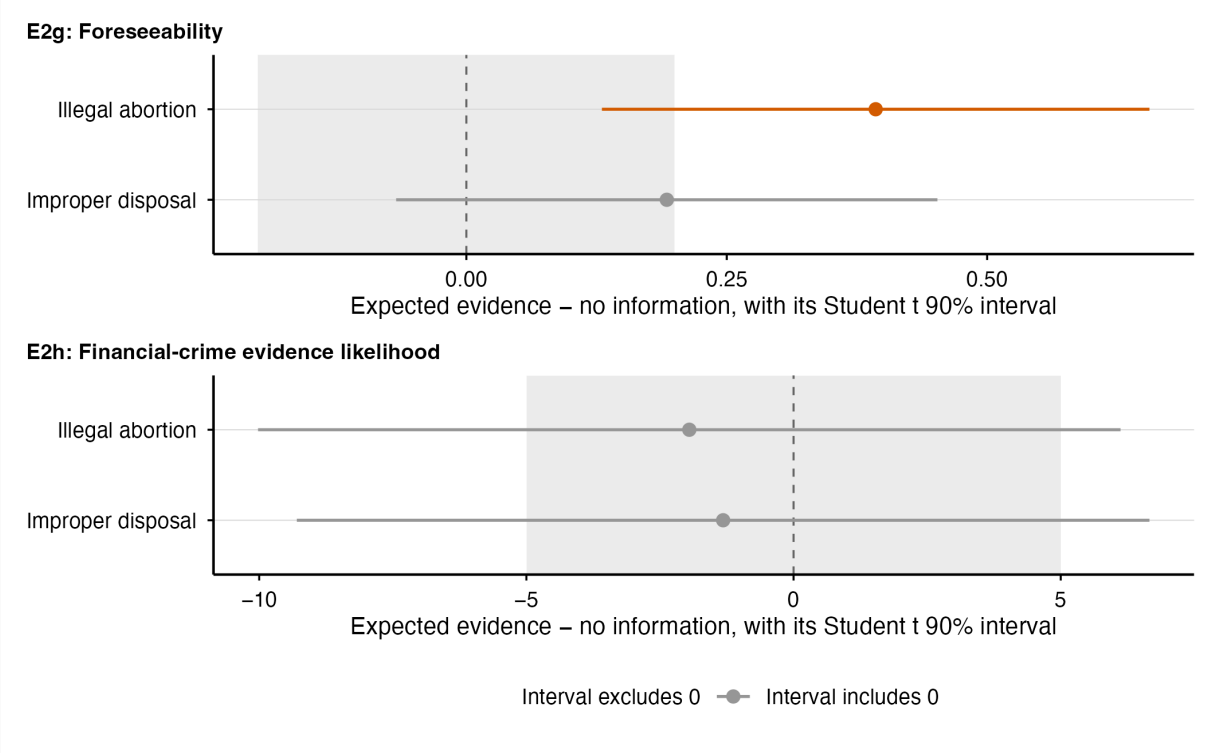
Note. Difference = adjusted mean after expected evidence minus adjusted mean after no information, from the model with the four attitudes. Interval: Student t, 90%, on the residual degrees of freedom. The two p values are the one-sided Student t tests against the lower and the upper bound. Reading, as registered: equivalent when the interval lies inside the bounds; otherwise a difference when the interval excludes zero, and inconclusive when it does not. The decision is read at the registered bounds only; the sensitivity bounds show whether the reading depends on the bounds. A letter is supported in a legal context when its interval lies on the predicted side of zero. Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Figure S5.4

Expected-evidence differences in foreseeability and financial-crime evidence likelihood against their registered equivalence bounds



© 2026 Emma Marshall · CC BY-NC-SA 4.0

Note. Points are the differences between expected evidence and no information in the primary sample, with the four attitudes as covariates. Bars are 90% Student *t* intervals. The shaded band marks the registered equivalence bounds for each judgment. Color shows only whether an interval excludes zero. Likelihood ratings are on the 0–100 scale, and foreseeability is on the 1–5 scale. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S5.7

Difference between the legal contexts in the expected-evidence comparison of abortion-evidence likelihood

Model	Letter	Predicted	Difference	SE	t	df	p	95% CI	Decision
With the four attitudes (registered)	E3a	Positive	7.82	6.62	1.18	388	.238	[−5.19, 20.83]	not supported
Without attitudes	E3a	Positive	7.11	6.84	1.04	392	.299	[−6.34, 20.56]	—

Note. Difference = the expected-evidence minus no-information difference in the illegal-abortion context minus the same difference in the improper-disposal context, from the saved abortion-evidence models. Differences of adjusted condition means with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of each model; no adjustment for multiple comparisons. The decision is read from the model with attitudes. A letter is supported in a legal context when its interval lies on the predicted side of zero. Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S5.8

Comparisons of the specific-minus-general foreseeability difference, with and without the attitudes

Comparison	Letter	Predicted	Difference	SE	z	p	95% CI	Decision
With the four attitudes (registered)								
Unexpected evidence – no information, illegal abortion	E5a	Negative	−0.233	0.179	−1.30	.194	[−0.585, 0.118]	not supported
Expected evidence – no information, illegal abortion	—	None	0.114	0.147	0.77	.440	[−0.175, 0.403]	—
Unexpected evidence – no information, improper disposal	E5a	Negative	−0.091	0.156	−0.58	.562	[−0.397, 0.216]	not supported
Expected evidence – no information, improper disposal	—	None	0.113	0.156	0.72	.470	[−0.193, 0.419]	—
Without attitudes								
Unexpected evidence – no information, illegal abortion	E5a	Negative	−0.238	0.181	−1.31	.189	[−0.592, 0.117]	—
Expected evidence –	—	None	0.120	0.148	0.81	.420	[−0.171, 0.410]	—

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Letter	Predicted	Difference	SE	z	p	95% CI	Decision
no information, illegal abortion								
Unexpected evidence – no information, improper disposal	E5a	Negative	−0.096	0.156	−0.62	.538	[−0.401, 0.209]	—
Expected evidence – no information, improper disposal	—	None	0.124	0.154	0.80	.421	[−0.178, 0.425]	—

Note. Difference = the comparison of the specific-minus-general foreseeability difference (the four-item foreseeability composite minus the general foreseeability item, both on the 1–5 scale) between two outcome conditions within a legal context, from the saved model that estimates the two measures jointly. Interval: Normal Wald, joint normal-ML covariance, two-sided 95%; z and p from the same standard error. n = 398 with the attitudes and 398 without. E5a reads the unexpected-evidence comparison; the expected-evidence comparison is reported without a directional prediction. The decision is read from the model with attitudes. A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Table S5.9

Expected-evidence by item-consistency coefficient of the crossed mixed model: the registered ten-item analysis and the eight-item sensitivity analysis

Analysis	Estimate	SE	df	95% CI	Predicted	Random structure	Ratings	Participants	Decision
Registered analysis (ten items)	1.258	0.264	395.0	[0.738, 1.777]	Positive	Correlated slope	3,980	398	supported
Sensitivity analysis (eight items; deviation item 1)	1.459	—	—	[0.899, 2.020]	Positive	Correlated slope	3,184	398	not a support criterion

Note. Unstandardized coefficient in rating-scale points (items rated 1 to 9): the difference between consistent and inconsistent items in the expected-evidence minus no-information difference. Interval: two-sided 95% from the t distribution with Satterthwaite degrees of freedom and the REML fixed-effect covariance (Satterthwaite t, REML fixed-effect covariance); no bootstrap is used in this analysis. Sensitivity analysis (deviations record, item 1; not registered and not a support criterion): the same model, the same fallback sequence for the random structure, and the same interval on items 1, 2, 4, 5, 6, 7, 8, 9, without the background items 3 and 10. The analysis saved the estimate and interval but not the SE or df. E4a is supported when the registered interval lies above zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S5.10

Fixed effects and variance components of the crossed mixed model of the relevance ratings

Term	Estimate	SE	df	t	p	95% CI
Fixed effects						
Intercept	6.031	0.570	9.7	10.58	< .001	[4.756, 7.306]

Term	Estimate	SE	df	t	p	95% CI
Unexpected evidence	−0.552	0.226	384.2	−2.44	.015	[−0.997, −0.107]
Item consistency (consistent = 1)	0.089	1.006	8.5	0.09	.931	[−2.207, 2.386]
Legal context (improper disposal = 1)	0.011	0.165	390.0	0.07	.946	[−0.313, 0.335]
Abortion attitudes	−0.003	0.004	390.0	−0.65	.516	[−0.011, 0.006]
Support for punishment	0.174	0.068	390.0	2.56	.011	[0.040, 0.308]
Hostile sexism	−0.040	0.080	390.0	−0.49	.622	[−0.198, 0.118]
Benevolent sexism	0.137	0.082	390.0	1.68	.093	[−0.023, 0.298]
Expected evidence × item consistency	1.258	0.264	395.0	4.76	< .001	[0.738, 1.777]
Unexpected evidence × item consistency	0.252	0.264	395.0	0.95	.340	[−0.267, 0.770]
Variance components						
Participant intercept variance	2.846					
Participant consistency slope variance	2.711					
Participant intercept–consistency slope covariance	−1.290 (r = −.465)					
Item intercept variance	2.053					
Residual variance	4.111					

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Term	Estimate	SE	df	t	p	95% CI

Note. Linear mixed model fitted by restricted maximum likelihood to 3,980 ratings from 398 participants, with participants and items as crossed random effects; random structure: participant random intercept and consistency slope, correlated (the registered structure). Fixed effects: unstandardized coefficients in rating-scale points, with t tests and two-sided 95% intervals on Satterthwaite degrees of freedom and the REML fixed-effect covariance, read from the saved model the way the analysis reads the registered coefficient. No information and the illegal-abortion context are the reference levels; the attitudes are grand-mean centered. Only the expected-evidence by item-consistency row is a registered quantity; the other rows describe the model. Variance components of the model used; a covariance row gives the correlation in parentheses. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S5.11

Variance components and intraclass correlations of the unconditional model with crossed random intercepts

Level	Variance	ICC
Participants	2.335	.258
Items	1.900	.210
Residual	4.806	—

Note. Unconditional model with crossed random intercepts for participants and items and no predictors, fitted by REML (Crossed random intercepts for participants and items (REML)). Each ICC is that level's share of the total variance. Reported as registered; the ICCs decide nothing. ICCs and variances are from the fitted model.

Table S5.12

The registered test of the random consistency slope and the random structure used

Quantity	Value
REML likelihood-ratio statistic, random slope against fixed slope	172.35

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Quantity	Value
Reference distribution	Equal mixture of chi-square distributions with 1 and 2 degrees of freedom
p	< .001
Random structure used	participant random intercept and consistency slope, correlated (the registered structure)
Steps of the registered fallback ladder	None: the registered structure converged and was not singular

Note. The test compares, by REML, the model with the participant random consistency slope and its covariance with the intercept against the model with the participant random intercept only (2 parameters added), and refers the statistic to the registered mixture (0.5 chi-square(1) + 0.5 chi-square(2)). As registered, the random slope is kept whatever the test shows; the structure is simplified only when a model does not converge or is singular, first by removing the intercept–slope covariance and then the slope, and the structure used is reported.

Table S5.13

Differences in the rated relevance of each evidence item between outcome information and no information

	Expected evidence – no information		Unexpected evidence – no information	
Item	**Difference**	**95% CI**	**Difference**	**95% CI**
Consistent with expected evidence				
Item 1	1.240	[0.632, 1.847]	−0.042	[−0.705, 0.621]
Item 6	−0.103	[−0.746, 0.540]	−0.175	[−0.863, 0.514]
Item 7	−0.263	[−0.846, 0.321]	−0.634	[−1.279, 0.011]
Inconsistent with expected evidence				
Item 2	−1.536	[−2.158, −0.914]	−0.741	[−1.407, −0.076]
Item 3	−0.395	[−0.981, 0.191]	−0.057	[−0.667, 0.553]
Item 4	−0.918	[−1.569, −0.266]	−0.186	[−0.867, 0.494]
Item 5	−1.545	[−2.152, −0.938]	−0.942	[−1.590, −0.295]
Item 8	−1.259	[−1.838, −0.680]	−0.986	[−1.598, −0.374]
Item 9	−0.563	[−1.134, 0.007]	−0.608	[−1.233, 0.016]
Item 10	−0.515	[−1.139, 0.109]	−0.234	[−0.858, 0.389]

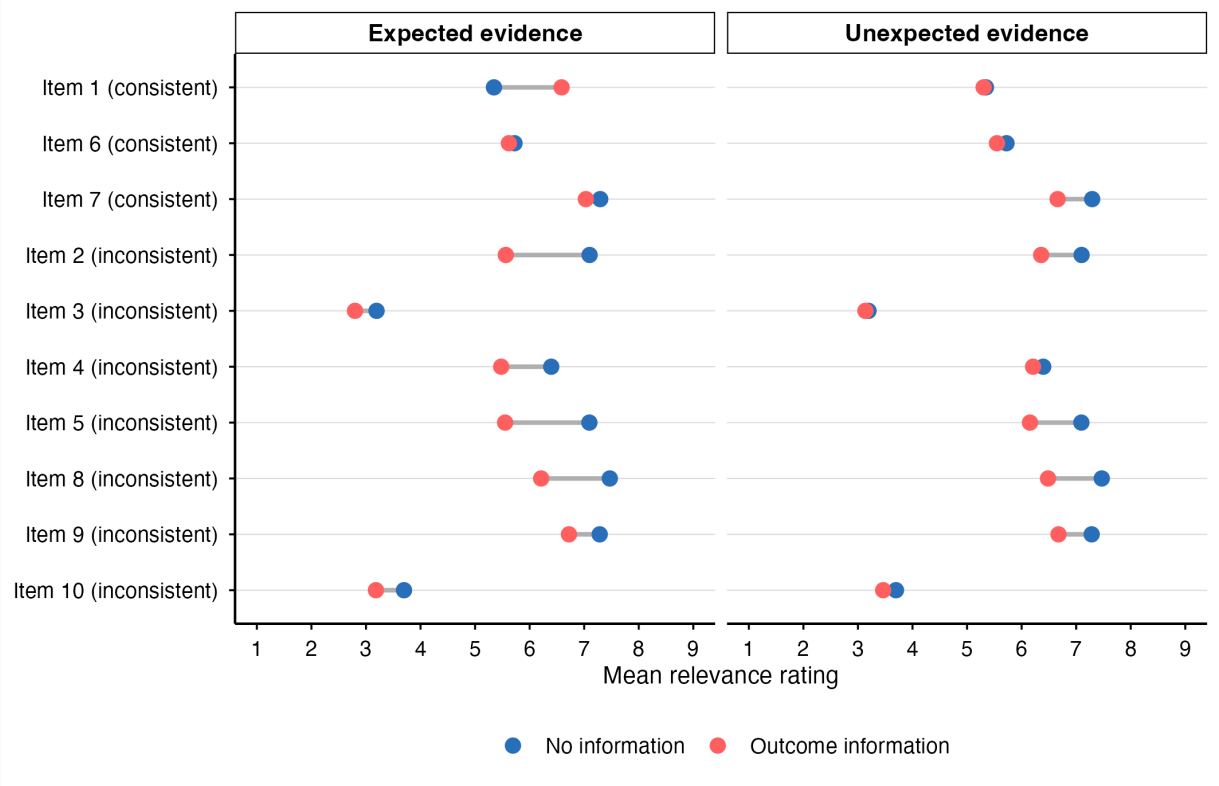
	Expected evidence – no information		Unexpected evidence – no information	
Item	**Difference**	**95% CI**	**Difference**	**95% CI**

Note. Differences in mean rated relevance (items rated 1 to 9), outcome information minus no information, averaging the two legal contexts with equal weight. Intervals: unadjusted two-sided 95% Welch intervals on the observed ratings, as registered; no covariates and no adjustment for the number of items. Reported descriptively, without a verdict. Every item is coded inconsistent with the unexpected evidence. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Figure S5.5

Mean rated relevance of each evidence item after no information and after outcome information



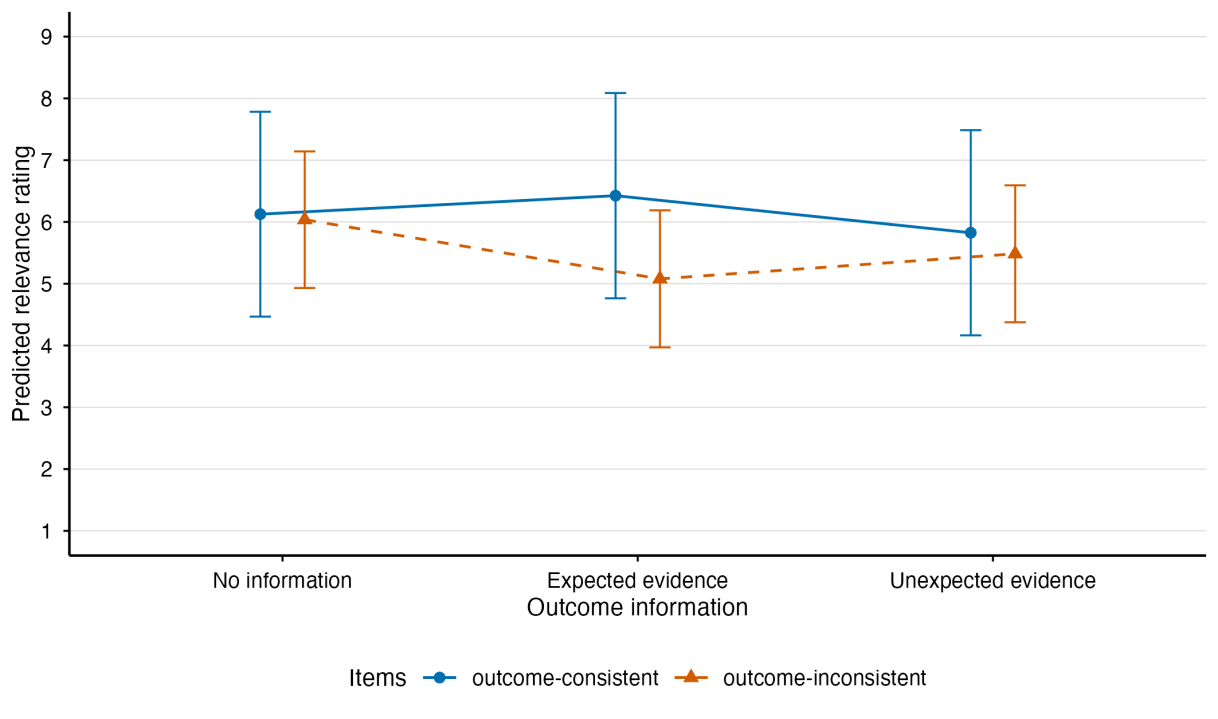
Note. Points are the mean observed relevance ratings (1 to 9) of each item, with the two legal contexts weighted equally. Each line runs from the mean after no information to the mean after the outcome information in that panel. I show the means without intervals here. The

© 2026 Emma Marshall · CC BY-NC-SA 4.0

item-difference table gives the differences and their unadjusted Welch 95% intervals. Table S5.9 gives the registered coefficient. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Figure S5.6

Model-predicted relevance of the outcome-consistent and outcome-inconsistent items after each kind of outcome information



Note. I used the mixed model to predict relevance ratings on the 1 to 9 scale. The points compare items consistent with expected evidence (i.e., 1, 6, and 7) with inconsistent items (i.e., 2, 3, 4, 5, 8, 9, and 10) under each outcome-information condition. I set the random effects to zero to obtain population means, holding attitudes at their participant means and weighting the legal contexts equally. The bars describe uncertainty in each mean: normal-based 95% intervals calculated by the delta method from the REML fixed-effect covariance. Their overlap does not test E4a. The registered comparison is the change in the difference between item sets from no information to expected evidence, reported in Table S5.9. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of

© 2026 Emma Marshall · CC BY-NC-SA 4.0

a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

S6. RQ2: exploratory analyses

Table S6.1

Differences between the legal contexts in the outcome comparisons of decision quality and the evaluations of the detective

Comparison	Difference	SE	t	df	p	95% CI
Decision quality						
Expected evidence – no information, abortion minus disposal	−0.53	0.40	−1.32	388	.186	[−1.32, 0.26]
Unexpected evidence – no information, abortion minus disposal	0.38	0.40	0.94	388	.346	[−0.41, 1.16]
Expected evidence – unexpected evidence, abortion minus disposal	−0.91	0.41	−2.23	388	.026	[−1.70, −0.11]
Detective blame						
Expected evidence – no information, abortion minus disposal	0.81	0.88	0.92	388	.359	[−0.93, 2.55]
Unexpected evidence – no information, abortion minus disposal	−0.54	0.88	−0.62	388	.539	[−2.27, 1.19]
Expected evidence – unexpected evidence, abortion minus disposal	1.35	0.90	1.51	388	.132	[−0.41, 3.11]
Consequences for the detective						
Expected evidence – no information, abortion minus disposal	1.27	0.76	1.66	388	.098	[−0.24, 2.77]
Unexpected evidence – no information, abortion minus disposal	−0.17	0.76	−0.22	388	.826	[−1.66, 1.33]
Expected evidence – unexpected evidence, abortion minus disposal	1.43	0.78	1.85	388	.065	[−0.09, 2.96]
Wrongness of the detective's decision						
Expected evidence – no information, abortion minus disposal	0.97	0.82	1.18	388	.240	[−0.65, 2.59]
Unexpected evidence – no information, abortion minus disposal	0.21	0.82	0.26	388	.797	[−1.40, 1.83]
Expected evidence – unexpected evidence, abortion minus disposal	0.76	0.84	0.91	388	.365	[−0.89, 2.40]

Comparison	Difference	SE	t	df	p	95% CI

Note. Each row is an outcome comparison in the illegal-abortion context minus the same comparison in the improper-disposal context, from the saved model with the four attitudes, with its Student t test and two-sided 95% Student t interval on the residual degrees of freedom; no adjustment for multiple comparisons. Reported without a verdict (no registered direction or decision rule). The rows without attitudes are in the companion table. Decision quality is in points on the 1–7 scale; detective blame, deserved consequences and wrongness are in points on their 0–10 scales. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S6.2

Direct outcome coefficients and judgment slopes of the decision-quality equation, by legal context, with their legal-context comparisons

Quantity	Letter	Estimate	95% CI	Test	p	Decision
Illegal abortion: coefficients (robust Wald)						
Expected evidence → decision quality (direct)	E6a	−0.031 (0.229)	[−0.480, 0.418]	—	—	not supported
Unexpected evidence → decision quality (direct)	E6b	0.465 (0.232)	[0.010, 0.919]	—	—	supported

Quantity	Letter	Estimate	95% CI	Test	p	Decision
Joint equality test (scaled chi-square difference)						
The five coefficients jointly equal across contexts	—	—	—	$\chi^2(5) = 4.36$	.499	—

Note. Unstandardized coefficients of the decision-quality equation in the original units (decision-quality points per point of the predictor; the outcome coefficients against no information), with robust (Huber–White) standard errors in parentheses and normal Wald 95% intervals. Differences are abortion minus disposal, each with the one-degree-of-freedom Satorra–Bentler (2010) scaled chi-square difference test of its equality; the joint test constrains the five coefficients together. The preference and attitude slopes stay free across contexts, as registered. Global fit of the registered model: scaled $\chi^2(28) = 26.85$, $p = .527$; robust CFI = 1.000; robust RMSEA = .000, 90% CI [.000, .052]; SRMR = .026. E6a–E6b read the direct outcome coefficients and E6c–E6f the full pathways, in each legal context; every other row, and every difference between the legal contexts, is reported without a verdict. A letter is supported when its interval lies on the predicted side of zero (for H2a–H2b and E6, in each legal context). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Note. Pathways are products of the unstandardized paths from the outcome contrast to decision quality, in decision-quality points; the summed rows add the full and the shorter pathway through the same judgment. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Differences are abortion minus disposal, with intervals from the same resamples. Predicted = the registered sign; None marks a pathway or difference without a registered direction. E6a–E6b read the direct outcome coefficients and E6c–E6f the full pathways, in each legal context; every other row, and every difference between the legal contexts, is reported without a verdict. A letter is supported when its interval lies on the predicted side of zero (for H2a–H2b and E6, in each legal context). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

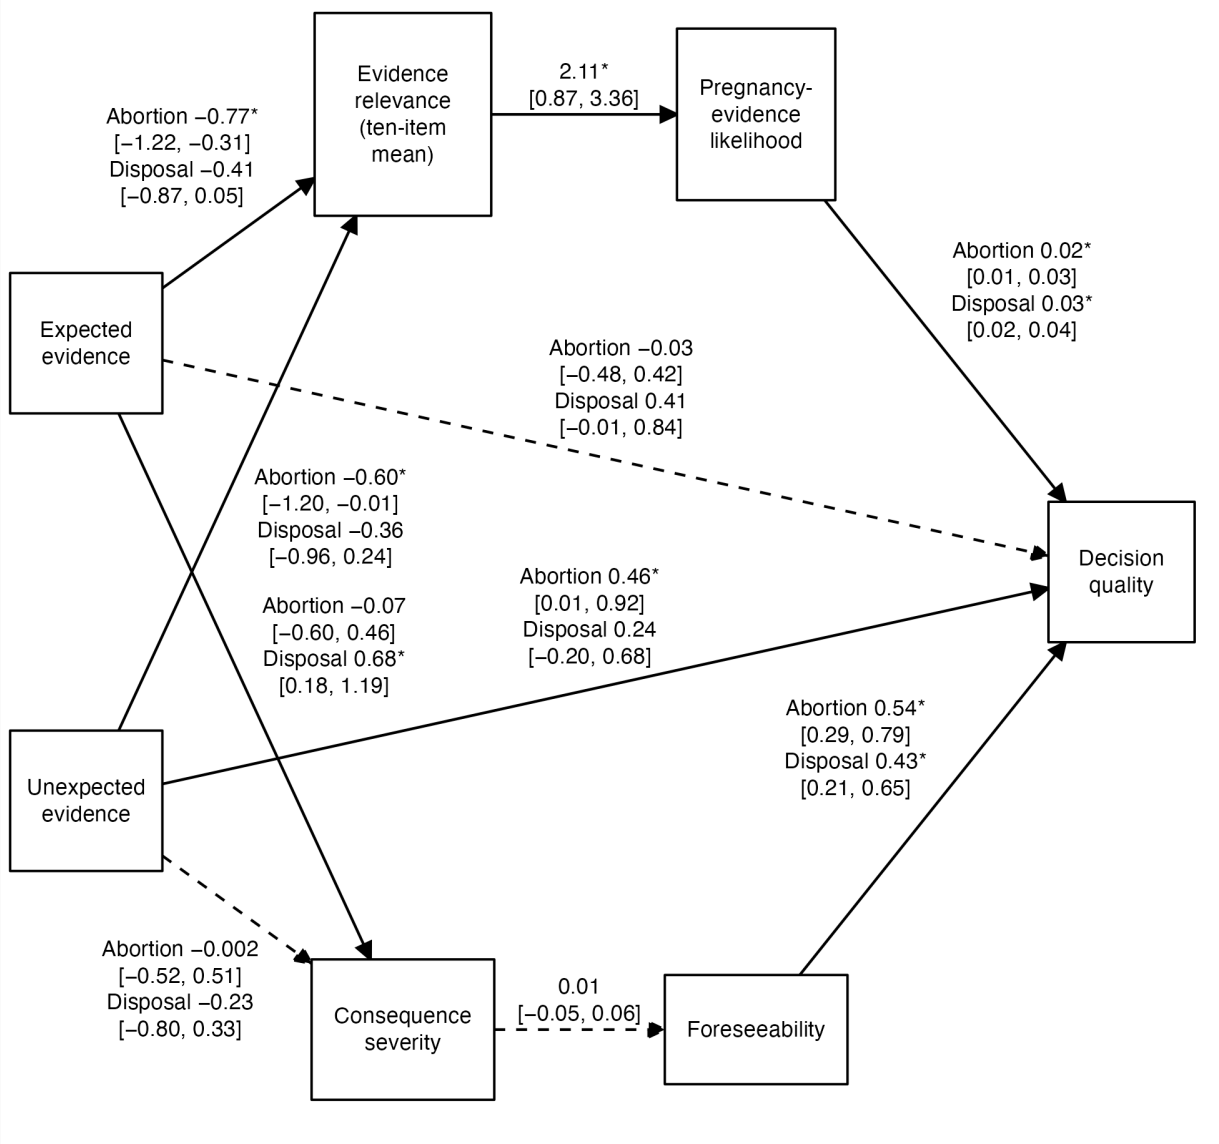
Figure S6.1

Fitted decision-quality chains (E6a–E6f)



Note. E6a–E6b are the direct paths to decision quality, E6c–E6d run through relevance and likelihood, and E6e–E6f run through severity and foreseeability. I fitted the registered H2a–H2b and E6 model in the primary sample with ten-item relevance means. Abortion and Disposal denote illegal abortion and improper disposal. Path labels give unstandardized estimates in the original units and robust (Huber–White) Wald 95% intervals. I estimated outcome-to-mediator and decision-quality paths separately by legal context, with common relevance-to-likelihood and severity-to-foreseeability paths. Dashed paths have a shared interval containing zero or both context intervals containing zero. The tables report indirect

© 2026 Emma Marshall · CC BY-NC-SA 4.0

effects and the omitted search-error-preference path, direct outcome paths to likelihood and foreseeability, attitude slopes, and disturbance covariances. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S6.4

Direct outcome coefficients and judgment slopes of the decision-quality equation without the attitudes (registered companion)

Quantity	Letter	Estimate	95% CI	Test	p
Illegal abortion: coefficients (robust Wald)

Note. Pathways are products of the unstandardized paths from the outcome contrast to decision quality, in decision-quality points; the summed rows add the full and the shorter pathway through the same judgment. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Differences are abortion minus disposal, with intervals from the same resamples. The registered companion model without attitudes; reported without a verdict. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Estimate	SE	t	p	95% CI
Unexpected evidence – no information	0.84	0.22	3.82	< .001	[0.41, 1.28]
Expected evidence – unexpected evidence	0.26	0.23	1.15	.251	[−0.19, 0.71]
Suspect wrongness					
Expected evidence – no information	1.50	0.23	6.42	< .001	[1.04, 1.96]
Unexpected evidence – no information	0.96	0.23	4.16	< .001	[0.51, 1.42]
Expected evidence – unexpected evidence	0.54	0.24	2.27	.024	[0.07, 1.01]
Responsibility					
Expected evidence – no information	2.31	0.24	9.65	< .001	[1.84, 2.78]
Unexpected evidence – no information	0.59	0.24	2.51	.013	[0.13, 1.06]
Expected evidence – unexpected evidence	1.72	0.24	7.04	< .001	[1.24, 2.19]

Note. Differences of adjusted outcome-condition means, each the equal-weight average of the two within-context differences, from a separate analysis of covariance of each judgment with the four attitudes as covariates: the registered H3a–H3b blame model with only the response changed. Student t 95% intervals from the conventional OLS covariance with the residual df; p two-sided. Exploratory: added after the registered results were known; no letter, no decision and no multiplicity correction. Favorable impression and justified reasons are scored so that higher means more favorable and more justified. n = 398 (primary sample, with the attitudes; complete cases on each judgment and the attitudes). The judgments tested here are rated on the 1–7 scale; differences and means are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Judgment	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence

Note. Each entry is the model-implied mean rating with its Student t 95% interval, from each judgment's analysis of covariance above, at the attitude means of the participants in the model. Exploratory. The judgments tested here are rated on the 1–7 scale; differences and means are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.4

Exploratory addition: E7a–E7g and E8c in the primary and the sensitivity sample (registered models with the attitudes; the sensitivity-sample rows carry no decision)

Comparison	Letter	Primary sample		Sensitivity sample	
		Difference	95% CI	Difference	95% CI
Punishment					
Expected evidence – no information	E7a	1.07	[0.69, 1.45]	1.10	[0.70, 1.51]
Unexpected evidence – no information	E7b	0.37	[−0.04, 0.78]	0.34	[−0.09, 0.77]
Expected evidence – unexpected evidence	E7c	0.70	[0.30, 1.09]	0.76	[0.35, 1.18]
Recklessness					
Expected evidence – no information	E7d	2.46	[2.08, 2.83]	2.77	[2.38, 3.15]
Unexpected evidence – no information	—	−0.21	[−0.61, 0.19]	−0.25	[−0.67, 0.18]
Expected evidence – unexpected evidence	E7e	2.67	[2.27, 3.06]	3.01	[2.61, 3.43]
Negligence					
Expected evidence – no information	E7f	2.38	[2.01, 2.73]	2.54	[2.14, 2.91]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

		Primary sample		Sensitivity sample	
Comparison	**Letter**	**Difference**	**95% CI**	**Difference**	**95% CI**
Unexpected evidence – no information	—	−0.17	[−0.57, 0.24]	−0.36	[−0.78, 0.06]
Expected evidence – unexpected evidence	E7g	2.54	[2.15, 2.92]	2.90	[2.50, 3.28]
Negligence minus purpose					
Expected evidence – no information	—	−0.88	[−1.21, −0.56]	−0.90	[−1.24, −0.58]
Unexpected evidence – no information	—	−0.36	[−0.69, −0.03]	−0.43	[−0.79, −0.07]
Expected evidence – unexpected evidence	E8c	−0.52	[−0.83, −0.21]	−0.47	[−0.80, −0.15]

Note. Differences of adjusted outcome-condition means, legal contexts averaged equally, from the registered analyses of covariance; percentile bootstrap 95% intervals. The primary-sample rows repeat those in the E7 and E8c tables below; decisions are read from the primary sample only (see those tables), and the sensitivity-sample rows are reported without a verdict. Usable bootstrap draws, sensitivity sample: 10000. The E8a and E8b comparisons in the sensitivity sample, and the condition means of blame, responsibility, punishment and wrongness from E8b's joint model, are saved with the analysis. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

Table S7.5

Substitute analysis of H3c–H3e: indirect effects of outcome information on blame through pregnancy-evidence likelihood, by legal context

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Expected evidence → pregnancy-evidence likelihood → blame	H3c	0.377	[0.094, 0.698]	Positive	substitute analysis: supported
Unexpected evidence → pregnancy-evidence likelihood → blame	H3d	−0.266	[−0.585, 0.027]	Negative	substitute analysis: not supported
Expected minus unexpected evidence, through pregnancy-evidence likelihood	H3e	0.643	[0.301, 1.044]	Positive	substitute analysis: supported
Improper disposal					
Expected evidence → pregnancy-evidence likelihood → blame	H3c	0.432	[0.161, 0.754]	Positive	substitute analysis: supported
Unexpected evidence → pregnancy-evidence likelihood → blame	H3d	−0.151	[−0.411, 0.103]	Negative	substitute analysis: not supported
Expected minus unexpected evidence, through pregnancy-evidence likelihood	H3e	0.583	[0.295, 0.919]	Positive	substitute analysis: supported
Illegal abortion minus improper disposal					
Expected evidence → pregnancy-evidence likelihood → blame	—	−0.055	[−0.482, 0.359]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood → blame	—	−0.114	[−0.520, 0.272]	None	reported without a verdict

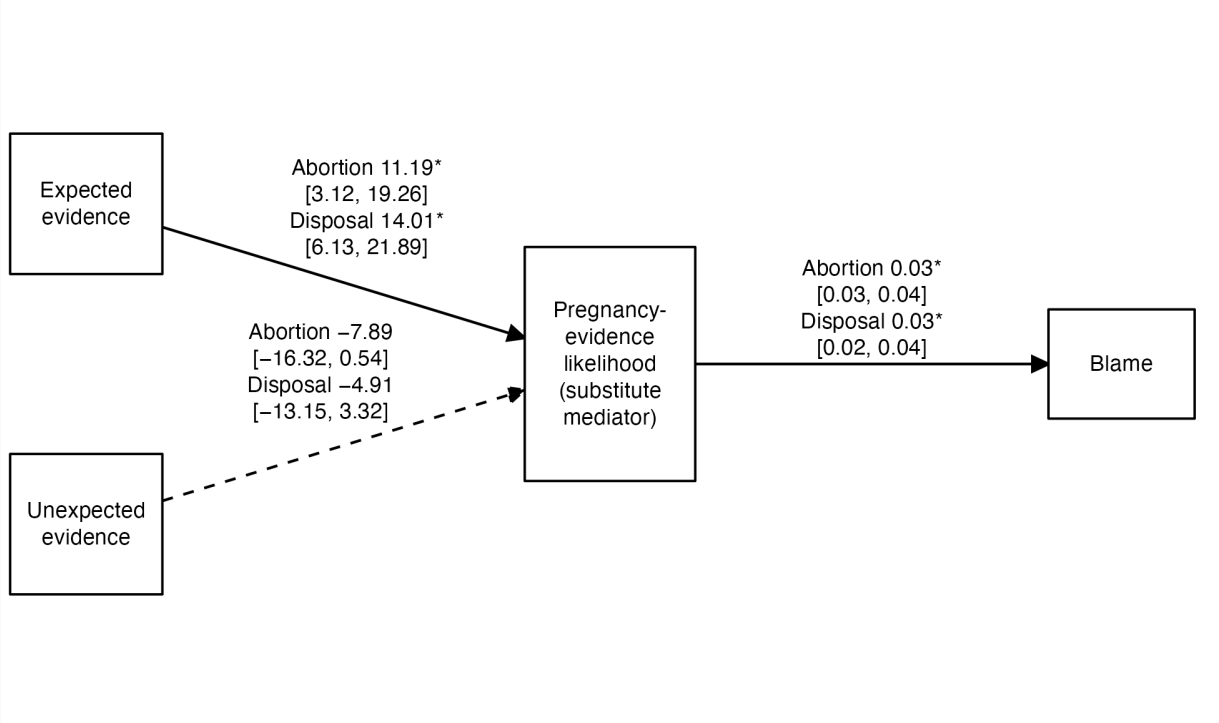
Pathway	Letter	Estimate	95% CI	Predicted	Decision

Note. Substitute analysis (deviation item 2): pregnancy-evidence likelihood replaces the registered mediator, which was not administered; the decisions are those of the substitute, not of the registered test. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-blame paths, in blame points per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. The model is just-identified, so it has no global fit. A letter is supported when its interval lies on the predicted side of zero. Every row of this analysis uses pregnancy-evidence likelihood as the substitute mediator (deviation 2 in S1). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Figure S7.1

Substitute analysis of H3c–H3e: the fitted chain of blame through pregnancy-evidence likelihood



© 2026 Emma Marshall · CC BY-NC-SA 4.0

Note. Fitted substitute model of outcome information and suspect blame through pregnancy-evidence likelihood, with the four attitudes in the primary sample (deviation 2 in S1). H3c concerns expected evidence and H3d unexpected evidence; H3e compares their indirect effects. Unstandardized estimates (robust [Huber–White] Wald 95% intervals) appear on each path in the original units. Abortion and Disposal identify the separate illegal-abortion and improper-disposal estimates. I used dashed lines where both context intervals contain zero and solid lines otherwise. The path table reports the direct effects of outcome information on blame, which are omitted here along with the attitude slopes. The indirect-effect table reports the path products. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S7.6

Substitute analysis of H3c–H3e: unstandardized path estimates, by legal context

	Illegal abortion			Improper disposal		
Predictor	**b (SE)**	**95% CI**	**p**	**b (SE)**	**95% CI**	**p**
Predicting pregnancy-evidence likelihood						
Expected evidence	11.191 (4.118)	[3.121, 19.261]	.007	14.007 (4.021)	[6.126, 21.889]	< .001

Benevolent sexism	−0.102 (0.106)	[−0.310, 0.106]	.335	0.002 (0.109)	[−0.213, 0.216]	.988

Note. Substitute analysis (deviation item 2). Unstandardized estimates in the original units with robust (Huber–White) standard errors, normal Wald 95% intervals and two-sided p. The covariance of the two disturbances is fixed at zero, as registered. Every row of this analysis uses pregnancy-evidence likelihood as the substitute mediator (deviation 2 in S1). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.7

Substitute analysis of H3c–H3e: variance explained in each equation, by legal context

Equation	Illegal abortion	Improper disposal
Pregnancy-evidence likelihood	.157	.159
Blame	.452	.478

Note. R^2 of each endogenous variable from the fitted model. R^2 does not depend on the fitting scale. Substitute analysis (deviation item 2). n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Table S7.8

Substitute analysis of H3c–H3e without the attitudes (registered companion)

Pathway	Letter	Estimate	95% CI	Predicted
Illegal abortion				
Expected evidence → pregnancy-evidence likelihood → blame	H3c	0.444	[0.106, 0.815]	Positive
Unexpected evidence → pregnancy-evidence likelihood → blame	H3d	−0.297	[−0.648, 0.032]	Negative
Expected minus unexpected evidence, through pregnancy-evidence likelihood	H3e	0.741	[0.355, 1.185]	Positive
Improper disposal				
Expected evidence → pregnancy-evidence likelihood → blame	H3c	0.566	[0.241, 0.932]	Positive
Unexpected evidence → pregnancy-evidence likelihood → blame	H3d	−0.185	[−0.503, 0.116]	Negative
Expected minus unexpected evidence, through pregnancy-evidence likelihood	H3e	0.751	[0.400, 1.133]	Positive
Illegal abortion minus improper disposal				
Expected evidence → pregnancy-evidence likelihood → blame	—	−0.122	[−0.604, 0.367]	None
Unexpected evidence → pregnancy-evidence likelihood → blame	—	−0.112	[−0.579, 0.343]	None

Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-blame paths, in blame points per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Reported beside the model with attitudes; decisions are read from the model with attitudes only. Every row of this analysis uses pregnancy-evidence likelihood as the substitute mediator (deviation 2 in S1). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.9

Adjusted-mean differences in punishment, recklessness and negligence across the outcome conditions, legal contexts averaged

Comparison	Letter	Predicted	Difference	95% CI	Decision
Punishment					
Expected evidence – no information	E7a	Positive	1.07	[0.69, 1.45]	supported
Unexpected evidence – no information	E7b	Positive	0.37	[−0.04, 0.78]	not supported
Expected evidence – unexpected evidence	E7c	Positive	0.70	[0.30, 1.09]	supported
Recklessness					
Expected evidence – no information	E7d	Positive	2.46	[2.08, 2.83]	supported
Unexpected evidence – no information	—	None	−0.21	[−0.61, 0.19]	reported without a verdict
Expected evidence – unexpected evidence	E7e	Positive	2.67	[2.27, 3.06]	supported
Negligence					
Expected evidence – no information	E7f	Positive	2.38	[2.01, 2.73]	supported
Unexpected evidence – no information	—	None	−0.17	[−0.57, 0.24]	reported without a verdict
Expected evidence – unexpected evidence	E7g	Positive	2.54	[2.15, 2.92]	supported

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Letter	Predicted	Difference	95% CI	Decision

Note. Differences of adjusted outcome-condition means, each the equal-weight average of the two within-context differences, from analyses of covariance with the four attitudes as covariates. Common attitude slopes (the registered model). Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. No item was missing, so no values were imputed. Predicted = the registered sign of the difference; the unexpected-evidence comparisons of recklessness and negligence have no registered direction and are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.10

Comparisons of punishment, recklessness and negligence with the attitude slopes free in each condition (registered sensitivity model)

Comparison	Letter	Predicted	Difference	95% CI
Punishment				
Expected evidence – no information	E7a	Positive	1.04	[0.67, 1.42]
Unexpected evidence – no information	E7b	Positive	0.36	[−0.06, 0.78]
Expected evidence – unexpected evidence	E7c	Positive	0.67	[0.27, 1.08]
Recklessness				
Expected evidence – no information	E7d	Positive	2.47	[2.08, 2.83]
Unexpected evidence – no information	—	None	−0.23	[−0.64, 0.19]
Expected evidence – unexpected evidence	E7e	Positive	2.69	[2.29, 3.08]
Negligence				
Expected evidence – no information	E7f	Positive	2.41	[2.01, 2.76]
Unexpected evidence – no information	—	None	−0.16	[−0.56, 0.26]
Expected evidence – unexpected evidence	E7g	Positive	2.56	[2.13, 2.95]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Letter	Predicted	Difference	95% CI

Note. Differences of adjusted outcome-condition means, each the equal-weight average of the two within-context differences, from analyses of covariance with the four attitudes as covariates. The attitude slopes are estimated separately in each of the six conditions. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. No item was missing, so no values were imputed. Reported to show whether the comparisons depend on common slopes; decisions are read from the registered model only. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Contrast	Letter	Estimate	SE	z	p	95% CI	Decision
Recklessness – negligence, unexpected evidence	E8a	−0.24	0.20	−1.18	.238	[−0.64, 0.16]	reported without a verdict

Note. Each estimate is a mean within-participant difference between two attributed mental states (purpose minus knowledge, recklessness minus negligence, knowledge minus recklessness) in one outcome condition, with the two legal contexts averaged equally; the gaps are the abortion-minus-disposal differences of the paired differences. Interval: Normal Wald, two-sided 95%; the test statistic and p from the same standard error. n = 398. The comparisons are linear functions of one joint model of the four ratings, with outcome-condition intercepts in each legal context, unrestricted residual covariances and the attitudes held at their means (the attitude reference enters the standard errors). E8a registers no direction and no decision rule; the knowledge-minus-recklessness difference is described, as registered. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.12

Rating profile of the four attributed mental states in each condition, from the saved joint model

Rating	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
Purpose	2.70 [2.36, 3.04]	5.78 [5.42, 6.13]	2.84 [2.39, 3.29]	2.48 [2.12, 2.84]	5.94 [5.62, 6.26]	2.73 [2.31, 3.16]
Knowledge	2.64 [2.30, 2.98]	5.42 [5.02, 5.83]	2.63 [2.19, 3.07]	2.68 [2.32, 3.03]	5.77 [5.46, 6.08]	2.55 [2.18, 2.91]
Recklessness	3.25 [2.86, 3.64]	5.76 [5.40, 6.13]	2.95 [2.49, 3.40]	3.20 [2.83, 3.57]	5.62 [5.25, 5.98]	3.09 [2.70, 3.48]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Rating	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
Negligence	3.60 [3.21, 3.98]	5.90 [5.54, 6.26]	3.37 [2.92, 3.82]	3.38 [2.99, 3.77]	5.84 [5.52, 6.16]	3.27 [2.85, 3.69]

Note. Each entry is the model-implied mean rating with its normal Wald 95% interval, from the saved main joint model of E8a: the condition intercept plus the attitude slopes at the attitude means of the participants in the model, with the reference term of the attitude means in the standard errors, as the analysis forms its comparisons. These means reproduce every saved E8a comparison. The registered description of the full rating profile; reported without a verdict. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Contrast	Letter	Estimate	SE	z	p	95% CI	Decision
Expected evidence – unexpected evidence	E8b	0.53	0.24	2.22	.027	[0.06, 1.01]	reported without a verdict

Note. The first band compares the effect of each kind of evidence (against no information) on punishment with its effect on another judgment; the other bands give the three outcome comparisons within each judgment. Legal contexts are averaged equally. Interval: Normal Wald, two-sided 95%; the test statistic and p from the same standard error. n = 398. The comparisons are linear functions of one joint model of the four ratings, with outcome-condition intercepts in each legal context, unrestricted residual covariances and the attitudes held at their means (the attitude reference enters the standard errors). E8b registers no direction and no decision rule. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.15

E8b comparisons with the attitude slopes free in each condition and without the attitudes (registered sensitivity models)

	Slopes free in each condition		Without attitudes	
Contrast	**Estimate**	**95% CI**	**Estimate**	**95% CI**

Note. The same comparisons as the table above, from the joint model with the attitude slopes estimated separately in each of the six conditions and from the joint model without the attitudes. Intervals: Normal Wald, two-sided 95%. Reported without a verdict. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.16

Comparisons of the negligence-minus-purpose difference across the outcome conditions, legal contexts averaged

Comparison	Letter	Predicted	Difference	95% CI	Decision
Expected evidence – no information	—	None	−0.88	[−1.21, −0.56]	reported without a verdict
Unexpected evidence – no information	—	None	−0.36	[−0.69, −0.03]	reported without a verdict
Expected evidence – unexpected evidence	E8c	Negative	−0.52	[−0.83, −0.21]	supported

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Letter	Predicted	Difference	95% CI	Decision

Note. Differences of adjusted outcome-condition means of each participant's negligence rating minus purpose rating, each the equal-weight average of the two within-context differences, from an analysis of covariance with the four attitudes as covariates. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. No item was missing, so no values were imputed. Predicted = the registered sign of the difference (E8c: less negligence relative to purpose after expected than after unexpected evidence); the two comparisons with no information have no registered direction and are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.17

Indirect effects of outcome information on blame through the four mediators, by legal context

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → pregnancy-evidence likelihood → blame	E9a	0.217	[0.047, 0.442]	Positive	supported
Expected evidence → foreseeability → blame	—	0.079	[−0.014, 0.225]	None	reported without a verdict
Expected evidence → negligence → blame	E9c	0.468	[0.035, 0.995]	Positive	supported
Expected evidence → recklessness → blame	E9d	0.470	[−0.048, 1.012]	Positive	not supported
Unexpected evidence → pregnancy-evidence likelihood → blame	E9b	−0.153	[−0.360, 0.011]	Negative	not supported

Pathway	Letter	Estimate	95% CI	Predicted	Decision

Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-blame paths, in blame points per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Predicted = the registered sign; the other indirect effects have no registered direction and are reported without a verdict. The model is just-identified, so it has no global fit. A letter is supported when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

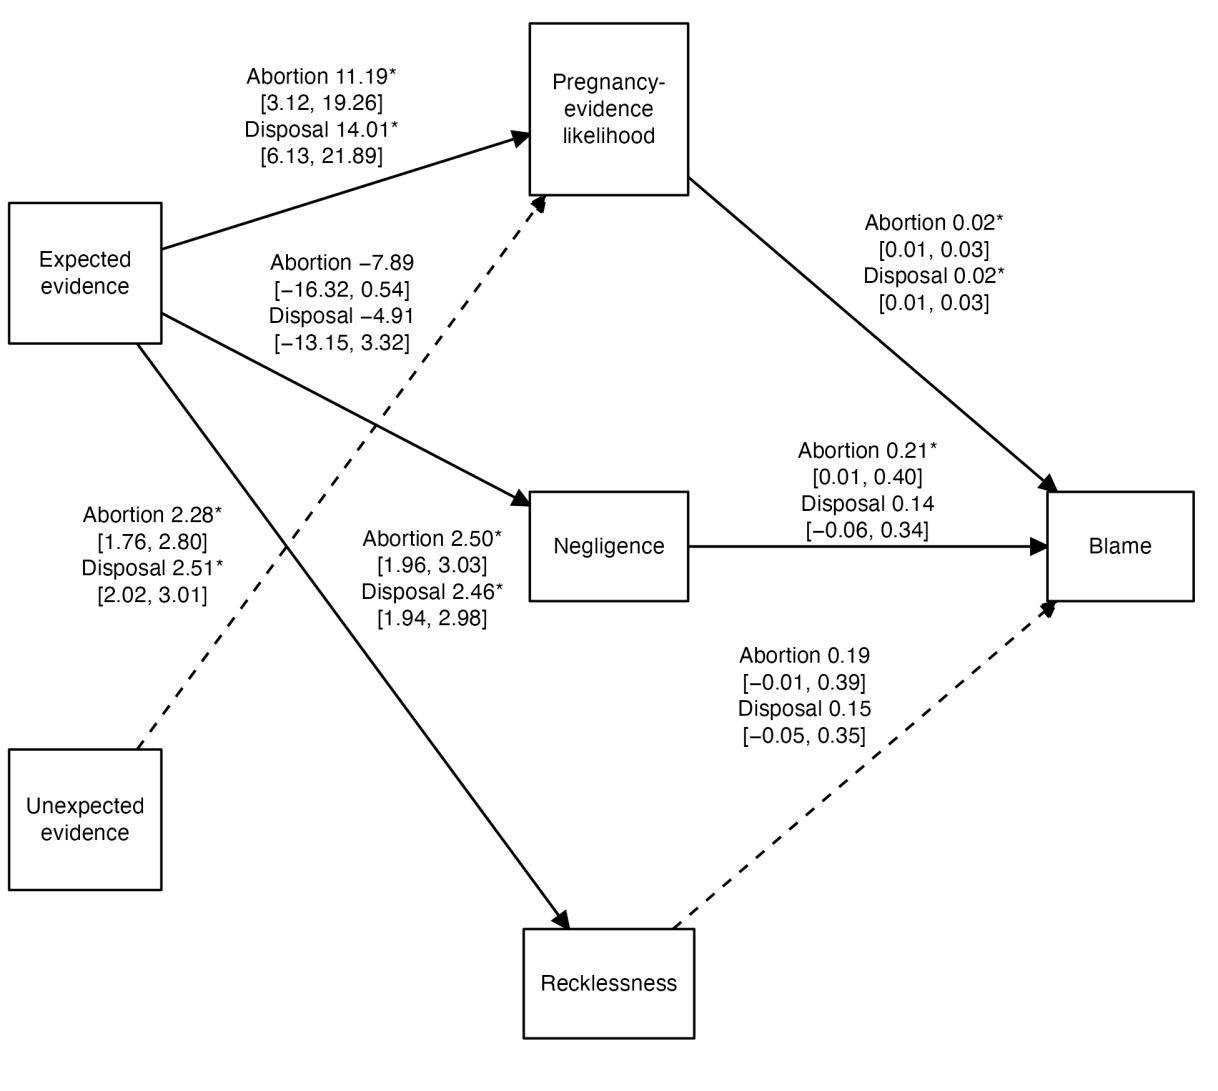
Figure S7.2

Fitted blame chains of the four-mediator model (E9a–E9d)



Note. E9a and E9b trace expected and unexpected evidence through pregnancy-evidence likelihood to blame. E9c traces expected evidence through negligence, and E9d traces it through recklessness. The fitted primary-sample model includes four mediators and the four attitudes. The paths give unstandardized estimates and robust (Huber–White) Wald 95% intervals in the original units. Each has separate estimates for illegal abortion and improper disposal, labeled Abortion and Disposal. I used dashed lines only when both context intervals included zero, and solid lines otherwise. I left foreseeability out of the diagram because none of its paths has a hypothesis letter. I also omit the paths from unexpected evidence to negligence and recklessness, direct paths from outcome information to blame, attitude slopes, and

© 2026 Emma Marshall · CC BY-NC-SA 4.0

mediator-disturbance covariances. The path table gives the direct paths. The indirect-effect table gives the products of the paths. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S7.18

Legal-context differences in the indirect effects and paths of the four-mediator model

Quantity	Estimate	SE	95% CI
Indirect effects, abortion minus disposal (percentile bootstrap)			
Expected evidence → pregnancy-evidence likelihood → blame	−0.083	—	[−0.408, 0.214]
Expected evidence → foreseeability → blame	0.037	—	[−0.116, 0.205]
Expected evidence → negligence → blame	0.118	—	[−0.567, 0.859]
Expected evidence → recklessness → blame	0.102	—	[−0.653, 0.865]
Unexpected evidence → pregnancy-evidence likelihood → blame	−0.047	—	[−0.326, 0.206]
Unexpected evidence → foreseeability → blame	0.042	—	[−0.108, 0.191]
Unexpected evidence → negligence → blame	−0.031	—	[−0.232, 0.141]
Unexpected evidence → recklessness → blame	−0.039	—	[−0.249, 0.125]
Paths, abortion minus disposal (robust Wald)			
Expected evidence → pregnancy-evidence likelihood	−2.816	5.755	[−14.097, 8.464]
Unexpected evidence → pregnancy-evidence likelihood	−2.977	6.014	[−14.764, 8.810]
Expected evidence → foreseeability	0.174	0.226	[−0.270, 0.617]
Unexpected evidence → foreseeability	0.217	0.216	[−0.206, 0.640]
Expected evidence → negligence	−0.231	0.366	[−0.949, 0.487]
Unexpected evidence → negligence	−0.126	0.418	[−0.944, 0.693]
Expected evidence → recklessness	0.036	0.380	[−0.708, 0.780]
Unexpected evidence → recklessness	−0.186	0.410	[−0.990, 0.618]
Expected evidence → blame	−0.558	0.410	[−1.361, 0.246]
Unexpected evidence → blame	−0.455	0.350	[−1.140, 0.231]
Pregnancy-evidence likelihood → blame	−0.002	0.007	[−0.015, 0.011]
Foreseeability → blame	0.006	0.184	[−0.354, 0.366]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Quantity	Estimate	SE	95% CI
Negligence → blame	0.066	0.143	[−0.214, 0.345]
Recklessness → blame	0.039	0.144	[−0.243, 0.320]

Note. Differences are abortion minus disposal. Indirect-effect differences: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Path differences: unstandardized, with robust (Huber–White) SE and normal Wald 95% intervals from the saved original-unit covariance. Reported without a verdict (no registered direction). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Equation	Illegal abortion	Improper disposal

Note. R^2 of each endogenous variable from the fitted model. R^2 does not depend on the fitting scale. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S7.21

Indirect effects of the four-mediator model without the attitudes (registered companion), by legal context

Pathway	Letter	Estimate	95% CI	Predicted
Illegal abortion				
Expected evidence → pregnancy-evidence likelihood → blame	E9a	0.265	[0.057, 0.529]	Positive
Expected evidence → foreseeability → blame	—	0.089	[−0.011, 0.244]	None
Expected evidence → negligence → blame	E9c	0.565	[0.062, 1.160]	Positive
Expected evidence → recklessness → blame	E9d	0.427	[−0.156, 1.024]	Positive
Unexpected evidence → pregnancy-evidence likelihood → blame	E9b	−0.177	[−0.410, 0.017]	Negative
Unexpected evidence → foreseeability → blame	—	−0.036	[−0.138, 0.036]	None
Unexpected evidence → negligence → blame	—	−0.059	[−0.268, 0.091]	None
Unexpected evidence → recklessness → blame	—	−0.053	[−0.247, 0.051]	None
Improper disposal				
Expected evidence → pregnancy-evidence likelihood → blame	E9a	0.364	[0.128, 0.672]	Positive
Expected evidence → foreseeability → blame	—	0.061	[−0.024, 0.214]	None
Expected evidence → negligence → blame	E9c	0.527	[0.005, 1.075]	Positive
Expected evidence → recklessness → blame	E9d	0.393	[−0.142, 0.948]	Positive
Unexpected evidence → pregnancy-evidence likelihood → blame	E9b	−0.119	[−0.332, 0.082]	Negative
Unexpected evidence → foreseeability → blame	—	−0.098	[−0.252, 0.014]	None
Unexpected evidence → negligence → blame	—	−0.026	[−0.186, 0.112]	None
Unexpected evidence → recklessness → blame	—	−0.017	[−0.141, 0.088]	None

Pathway	Letter	Estimate	95% CI	Predicted

Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-blame paths, in blame points per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Reported beside the model with attitudes; decisions are read from the model with attitudes only. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

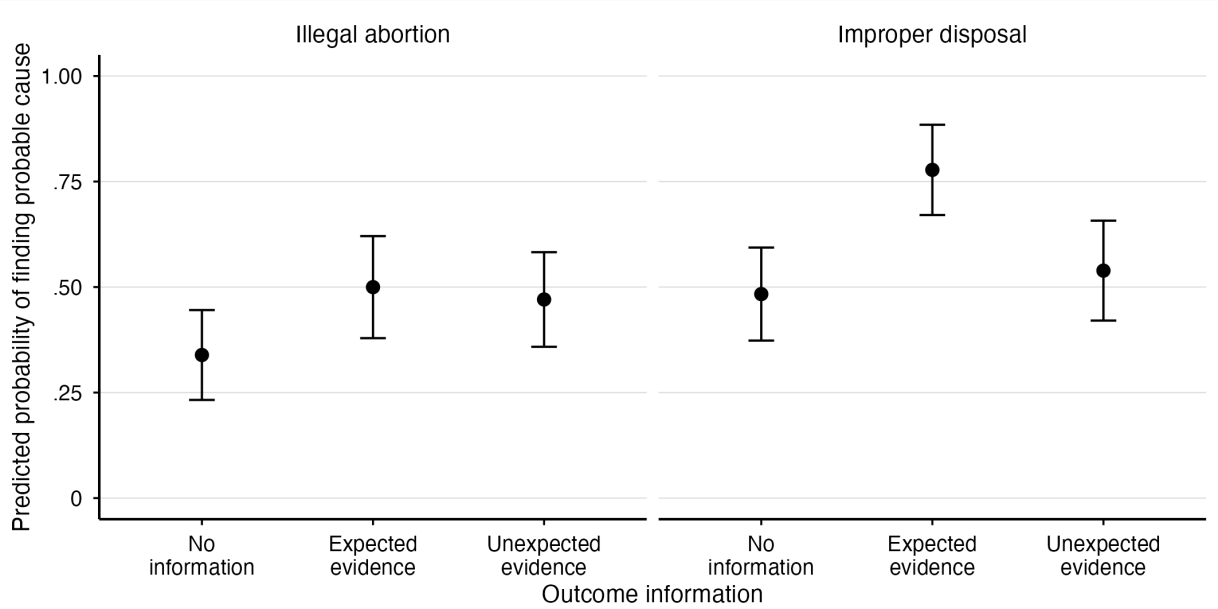
S8. RQ4: The registered mediation analyses and additional analyses

Figure S8.1

Predicted probability of finding probable cause after each kind of outcome information, by legal context



Note. I used the primary-sample probit model to predict each participant's probable cause ruling in every condition, retaining that participant's attitudes. The points average these marginaleffects predictions. The bars give two-sided 95% delta-method intervals based on the model's robust covariance. The intervals are symmetric on the probability scale and can extend beyond its limits. The registered comparisons and their percentile bootstrap intervals are in the tables. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S8.1

Differences in the probability of finding probable cause between outcome conditions and between legal contexts

Comparison	Letter	Predicted	Difference	95% CI	Decision
Outcome comparisons, legal contexts averaged					
Expected evidence – no information	H4a	Positive	.228	[.117, .337]	supported
Expected evidence – unexpected evidence	E10a	Positive	.134	[.020, .249]	supported
Unexpected evidence – no information	E10b	Positive	.094	[−.022, .208]	not supported
Legal-context comparisons, outcome conditions weighted equally					
Illegal abortion – improper disposal, outcome conditions weighted equally	—	None	−.163	[−.259, −.070]	reported without a verdict
Expected evidence – no information, illegal abortion minus improper disposal	—	None	−.133	[−.352, .089]	reported without a verdict
Unexpected evidence – no information, illegal abortion minus improper disposal	—	None	.076	[−.147, .306]	reported without a verdict

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Letter	Predicted	Difference	95% CI	Decision

Note. Differences between average predicted probabilities of a probable-cause ruling from the saved probit, each probability averaged over every participant of the sample predicted in the condition; the legal-context rows compare the two contexts averaged over the outcome conditions, and the differences in the effect of each kind of evidence between the contexts. H4a is the registered hypothesis of the manuscript; E10a–E10b and the legal-context rows are exploratory. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. No attitude was missing, so no values were imputed. Predicted = the registered sign of the difference; the legal-context comparisons have no registered direction and are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Probabilities and their differences are in probability units. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.2

Adjusted-mean differences in confidence in the chosen ruling between outcome conditions and between legal contexts

Comparison	Letter	Predicted	Difference	95% CI	Decision
Outcome comparisons, legal contexts averaged					
Expected evidence – no information	E10c	Positive	5.06	[0.29, 9.61]	supported
Expected evidence – unexpected evidence	—	None	1.32	[−3.57, 6.22]	reported without a verdict
Unexpected evidence – no information	E10d	Positive	3.75	[−1.06, 8.32]	not supported
Legal-context comparisons, outcome conditions weighted equally					
Illegal abortion – improper disposal, outcome conditions weighted equally	—	None	−0.99	[−4.76, 2.89]	reported without a verdict
Expected evidence – no information, illegal	—	None	1.33	[−7.56, 10.35]	reported without a verdict

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Letter	Predicted	Difference	95% CI	Decision
abortion minus improper disposal					
Unexpected evidence – no information, illegal abortion minus improper disposal	—	None	12.30	[3.08, 21.73]	reported without a verdict

Note. Differences of adjusted condition means of confidence from the saved analysis of covariance with the four attitudes as covariates (common slopes), each outcome comparison the equal-weight average of the two within-context differences; the legal-context rows compare the two contexts averaged over the outcome conditions, and the differences in the effect of each kind of evidence between the contexts. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. No attitude was missing, so no values were imputed. Predicted = the registered sign of the difference; the comparison of expected with unexpected evidence and the legal-context comparisons have no registered direction and are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Confidence in the chosen ruling is rated on the 0–100 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.3

Adjusted condition means of confidence in the chosen ruling

	Illegal abortion		Improper disposal		Both contexts (equal weights)
Condition	M	n	M	n	M
No information	72.16	68	77.69	71	74.92
Expected evidence	77.89	63	82.09	66	79.99
Unexpected evidence	82.06	63	75.28	67	78.67

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	Illegal abortion		Improper disposal		Both contexts (equal weights)
Condition	**M**	**n**	**M**	**n**	**M**

Note. Adjusted means of confidence from the saved analysis of covariance, at the attitude means of the participants in the model; n = participants in the condition. The context-averaged column weights the two contexts equally; its differences are the registered outcome comparisons above. Confidence in the chosen ruling is rated on the 0–100 scale; differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.4

Source table of the analysis of covariance of confidence in the chosen ruling

Source	F	df1	df2	p	Partial η²	90% CI
Legal context	0.30	1	388	.587	.001	[.000, 1.000]
Outcome information	2.36	2	388	.096	.012	[.000, 1.000]
Abortion attitudes	0.54	1	388	.464	.001	[.000, 1.000]
Support for punishment	1.37	1	388	.242	.004	[.000, 1.000]
Hostile sexism	0.00	1	388	.945	.000	[.000, 1.000]
Benevolent sexism	0.03	1	388	.866	.000	[.000, 1.000]
Legal context × outcome information	3.92	2	388	.021	.020	[.004, 1.000]

Note. Analysis of Covariance (ANCOVA) with the four attitudes as covariates. Type-II F-tests. Partial η² = partial eta-squared (η^2_p) with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. A standard decomposition reported for its effect sizes; the registered tests are the comparisons and their bootstrap intervals, not these F tests.

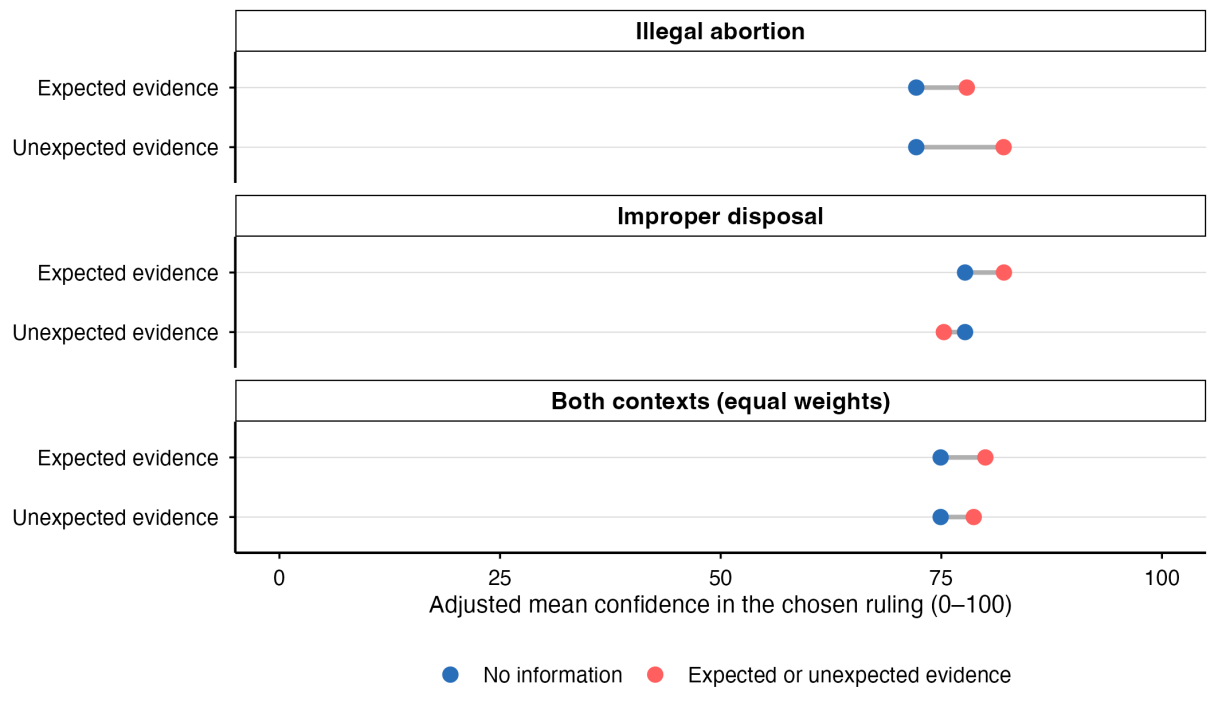
Figure S8.2

Adjusted mean confidence in the chosen ruling: no information against expected and unexpected evidence



Note. Adjusted mean confidence from the analysis of covariance in the primary sample, with the four attitudes held at their means. The lines connect no information with expected or unexpected evidence. I weighted the legal contexts equally in the bottom panel to show the E10c and E10d comparisons. I show means without intervals here. The table above gives the comparisons and their percentile bootstrap intervals. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Support for punishment	0.0288	[−0.1924, 0.2396]	0.2362	[0.0553, 0.4854]
Hostile sexism	−0.1248	[−0.4017, 0.1156]	−0.1041	[−0.3963, 0.1762]
Benevolent sexism	0.1044	[−0.1762, 0.3926]	−0.2732	[−0.6279, −0.0521]

Note. Unstandardized probit slopes of a probable-cause ruling on all predictors at once, estimated separately in each legal context; each is a conditional association with the other predictors held constant. Reported without a verdict (no registered direction or decision rule). Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. No attitude was missing, so no values were imputed. Probit slopes, in probit units per scale point of each predictor: pregnancy-evidence likelihood (0–100), foreseeability (1–5), evidence relevance (1–9, the ten-item mean), negligence (1–7), suspect blame (1–7), abortion attitudes (14–98, the item sum), support for punishment (1–7), hostile and benevolent sexism (0–5); the outcome indicators compare each kind of evidence with no information. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Table S8.6

Thresholds of the joint probit model in each legal context

Model	Illegal abortion	Improper disposal
With the four attitudes (registered)	4.364	3.886
Without attitudes (registered companion)	3.980	3.426

Note. The threshold of the latent response in each legal context (probit units, residual variance fixed at one), with every predictor at zero; the registration reports the thresholds without an interval. The predictors are not centered, so the thresholds are not probabilities at the sample means. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.7

Joint predictors of the ruling without the attitudes (registered companion)

	Illegal abortion		Improper disposal	
Predictor	**b**	**95% CI**	**b**	**95% CI**
Outcome information				
Expected evidence (vs. no information)	−0.3772	[−1.0421, 0.2396]	−0.1761	[−0.9117, 0.5650]
Unexpected evidence (vs. no information)	0.7690	[0.2337, 1.4951]	0.2503	[−0.3258, 0.8904]
Judgments

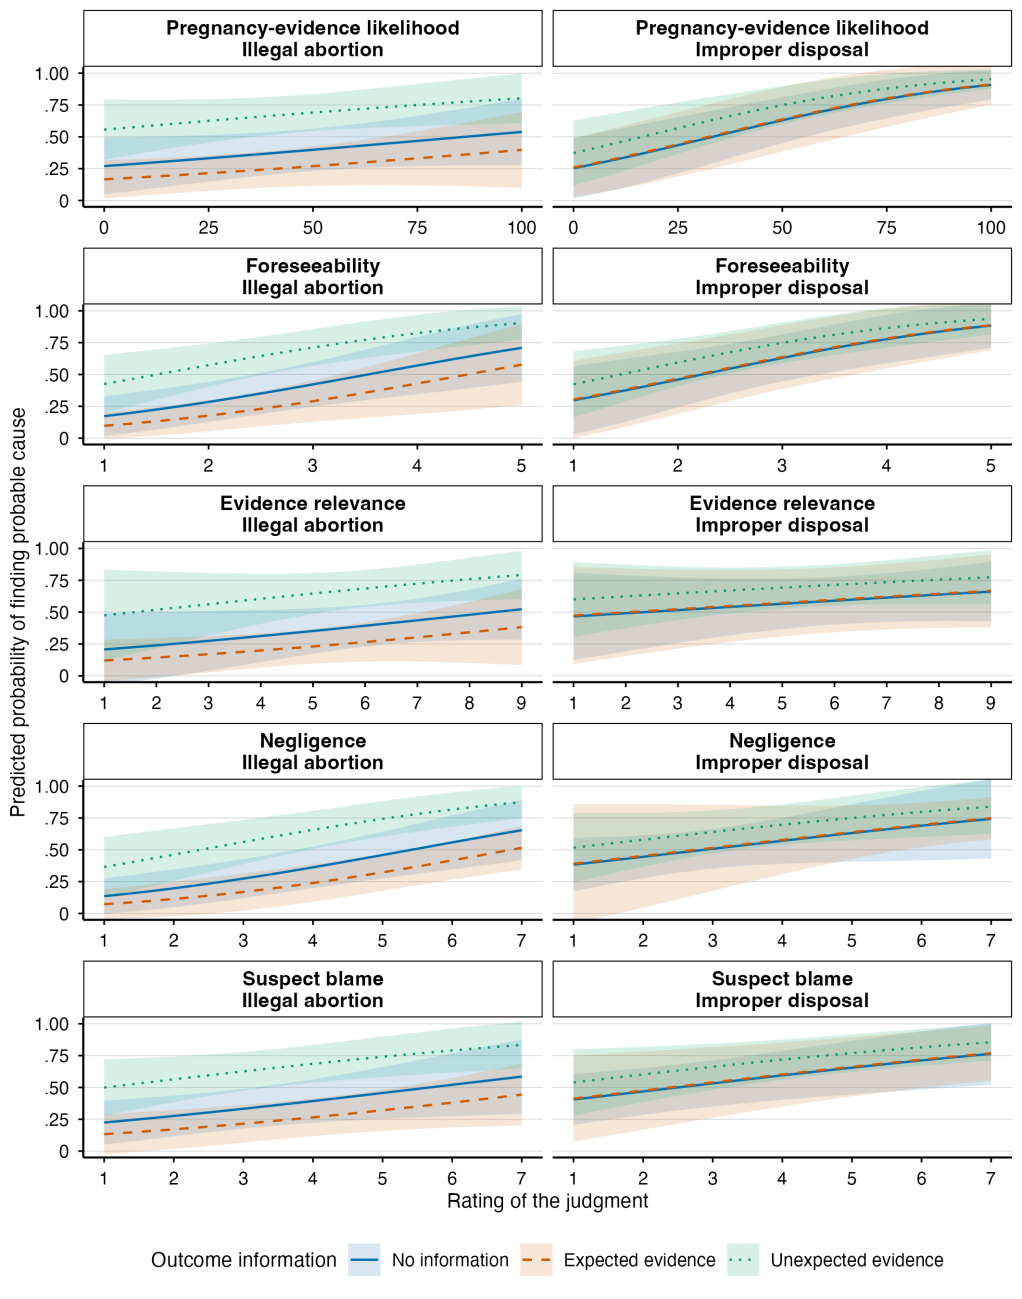
Figure S8.3

Predicted probability of finding probable cause across each judgment in the joint model, by legal context and outcome information



Note. Predicted probabilities of a probable cause ruling from the joint probit model with the attitudes in the primary sample. I varied one judgment across its observed range in each panel, holding the other four judgments and four attitudes at the means of all participants

© 2026 Emma Marshall · CC BY-NC-SA 4.0

in the model. Evidence relevance is the observed ten-item mean. I evaluated predictions on a fixed grid and used the robust covariance to obtain two-sided 95% delta-method bands, truncating the symmetric probability-scale intervals at 0 and 1. The table above reports the slopes with percentile bootstrap intervals. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S8.8

Serial indirect effects of outcome information on scalar probable cause–confidence, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4b	−1.471	[−3.659, −0.277]	Positive	not supported
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4c	−1.160	[−3.190, −0.027]	Negative	supported
Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4d	−0.312	[−1.880, 0.896]	Positive	not supported
Expected evidence → consequence severity →	—	−0.014	[−0.477, 0.417]	None	reported without a verdict

Unexpected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	−0.042	[−0.582, 0.397]	None	reported without a verdict

© 2026 Emma Marshall · CC BY-NC-SA 4.0

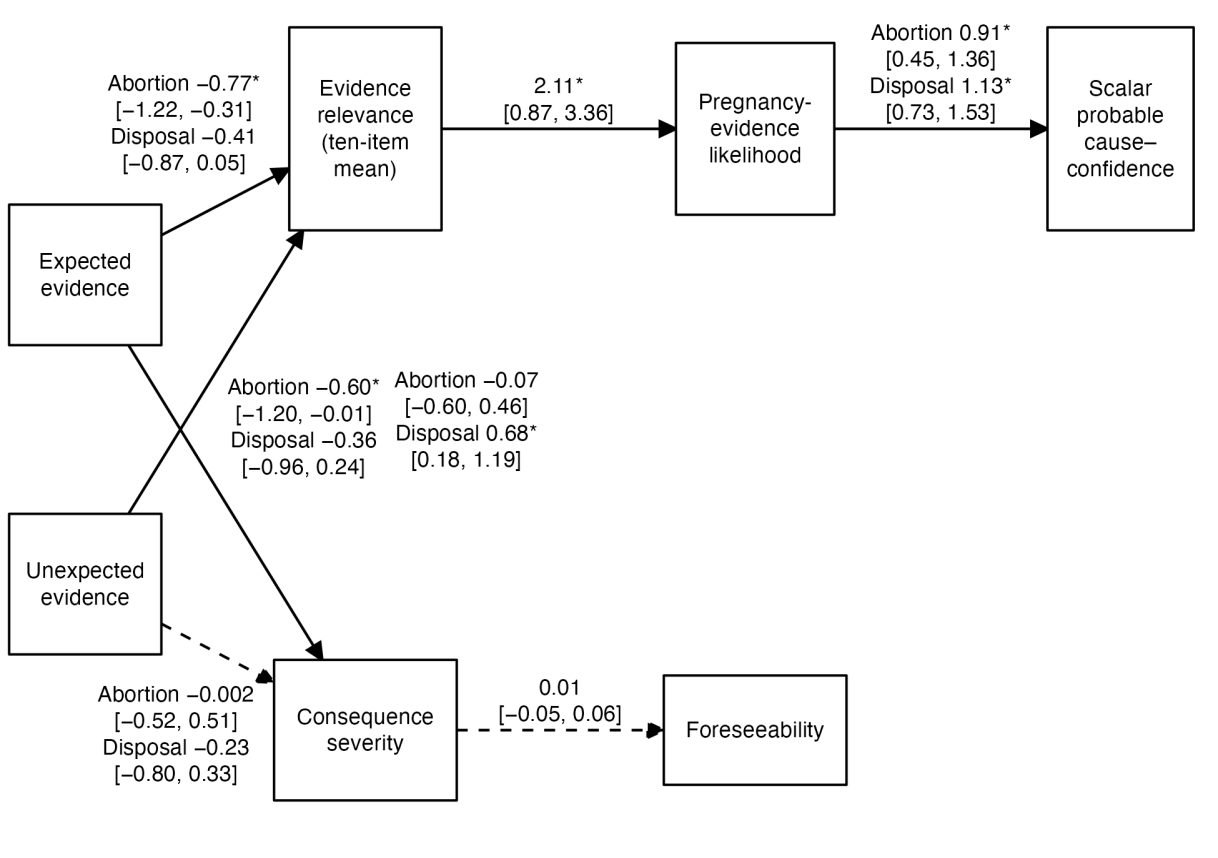
Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	−5.877	[−13.388, 0.962]	None	reported without a verdict
Unexpected evidence → foreseeability → scalar probable cause–confidence	—	−5.888	[−12.045, −1.122]	None	reported without a verdict

Note. Registered quantities first: the serial indirect effects through evidence relevance and then pregnancy-evidence likelihood (H4b–H4d); the foreseeability and likelihood-only pathways follow, reported without a registered direction. Indirect effects are products of the unstandardized paths of their route, in scalar probable cause–confidence points (−100 to 100) per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Global fit of the registered model: scaled $\chi^2(30) = 33.71$, $p = .293$; robust CFI = .996; robust RMSEA = .025, 90% CI [.000, .062]; SRMR = .031. Scalar probable cause–confidence is the confidence rating when the participant found probable cause and its negative when they did not. A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Figure S8.4

Fitted hypothesized chains of the registered serial model (H4b–H4d)



Note. H4b and H4c trace expected and unexpected evidence through evidence relevance and pregnancy-evidence likelihood to scalar probable cause confidence. H4d is the difference between these indirect effects. The registered primary-sample model uses the ten-item mean for relevance. I retained the H1 route through consequence severity to foreseeability. Path labels give unstandardized estimates in the original units, with robust (Huber–White) Wald 95% intervals. The paths from outcome information to each mediator and from likelihood to the outcome have separate estimates for illegal abortion and improper disposal, labeled Abortion and Disposal. Both contexts share the relevance-to-likelihood and severity-to-foreseeability estimates. Solid lines indicate intervals excluding zero; dashed lines indicate intervals including it. I dash a path with two estimates only when both intervals include zero. The path table gives the omitted direct paths from outcome information to likelihood, foreseeability, and the outcome, the foreseeability-to-outcome path, attitude slopes, and disturbance covariances. The indirect-effect table gives the products of the paths. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition:

© 2026 Emma Marshall · CC BY-NC-SA 4.0

illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S8.9

Indirect effects of outcome information on the probable-cause ruling through evidence relevance, severity, likelihood and foreseeability, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → evidence relevance → pregnancy-evidence likelihood → probable-cause ruling	E12a	−0.0552	[−0.1513, −0.0153]	Positive	not supported
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → probable-cause ruling	E12b	−0.0457	[−0.1490, −0.0020]	Negative	supported

Quantity	Letter	Estimate	95% CI	Predicted	Decision

Note. Registered quantities first in each legal context: the serial indirect effects through evidence relevance and pregnancy-evidence likelihood (E12a–E12c); the other pathways, their totals and the abortion-minus-disposal differences are reported without a registered direction. Indirect effects are products of the unstandardized paths of their route, in probit units of the ruling per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 9,919 usable. The run reports no global fit for a model with a probit endpoint (the registration names none). No item was missing. A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.10

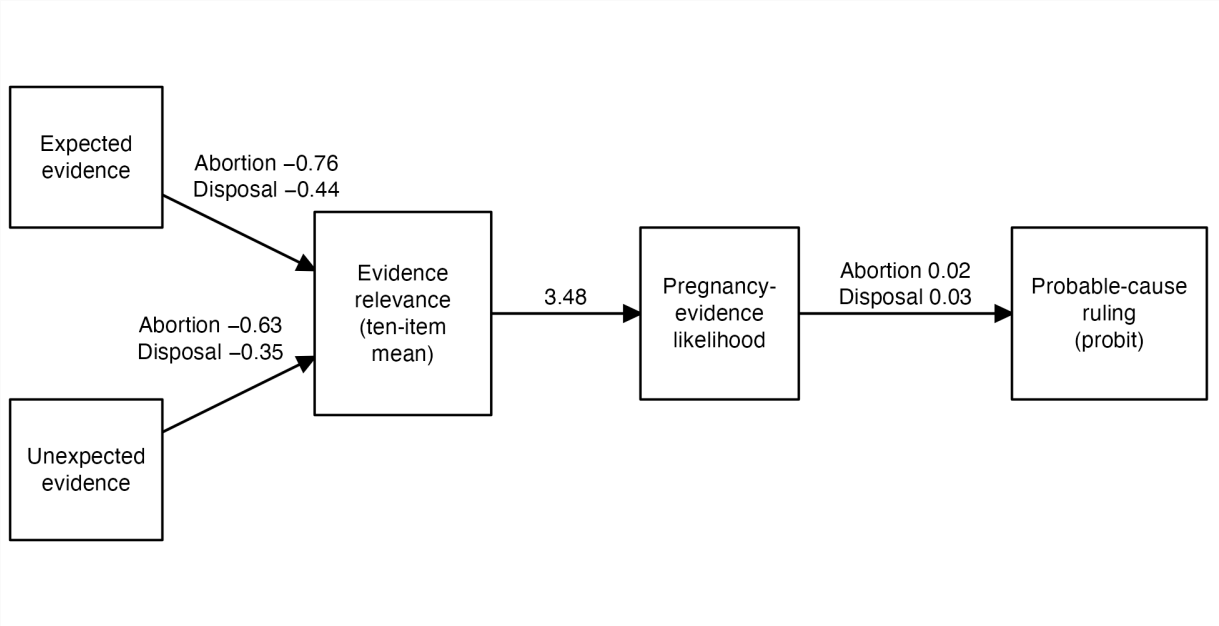
Note. Coefficients are unstandardized, in probit units per unit of the predictor (the latent response variance is fixed at one). Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 9,919 usable, as registered for the probit endpoints. Reported without a registered direction. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Figure S8.5

Fitted relevance chain of the probable-cause ruling (E12a–E12c)



Note. E12a and E12b trace expected and unexpected evidence through evidence relevance and pregnancy-evidence likelihood to the probable cause ruling. E12c is the difference between these indirect effects. I show these pathways from the fitted registered model with the

© 2026 Emma Marshall · CC BY-NC-SA 4.0

four attitudes in the primary sample. Path labels give unstandardized estimates in the original units, with the ruling's endpoint path in probit units. The coefficient table gives registered percentile bootstrap intervals for the paths into the ruling. The path table gives robust Wald intervals for every path. The paths from outcome information to relevance and from likelihood to the ruling have separate estimates for illegal abortion and improper disposal, labeled Abortion and Disposal. Both contexts share the relevance-to-likelihood estimate. I draw every path as a solid line. I omit the severity route, direct paths, attitude slopes, and disturbance covariances. The path table gives the direct paths. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Quantity	Letter	Estimate	95% CI	Predicted

Note. Indirect effects are products of the unstandardized paths of their route, in probit units of the ruling per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 9,919 usable. Coefficients are unstandardized, in probit units per unit of the predictor (the latent response variance is fixed at one). Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 9,919 usable, as registered for the probit endpoints. Reported beside the model with attitudes; decisions are read from the model with attitudes only. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Quantity	Letter	Estimate	95% CI	Predicted	Decision
→ pregnancy-evidence likelihood → confidence in the ruling					
Unexpected evidence → consequence severity → foreseeability → confidence in the ruling	E12d	−0.0002	[−0.052, 0.061]	None	reported without a verdict
Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → confidence in the ruling	E12d	0.017	[−0.160, 0.181]	None	reported without a verdict
Expected minus unexpected evidence → consequence severity → foreseeability → confidence in the ruling	E12d	0.002	[−0.110, 0.090]	None	reported without a verdict

Note. E12d has no registered direction: every quantity is reported without a verdict. Indirect effects are products of the unstandardized paths of their route, in confidence points (0–100) per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Global fit of the registered model: scaled $\chi^2(30) = 27.99$, $p = .571$; robust CFI = 1.000; robust RMSEA = .000, 90% CI [.000, .050]; SRMR = .028. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

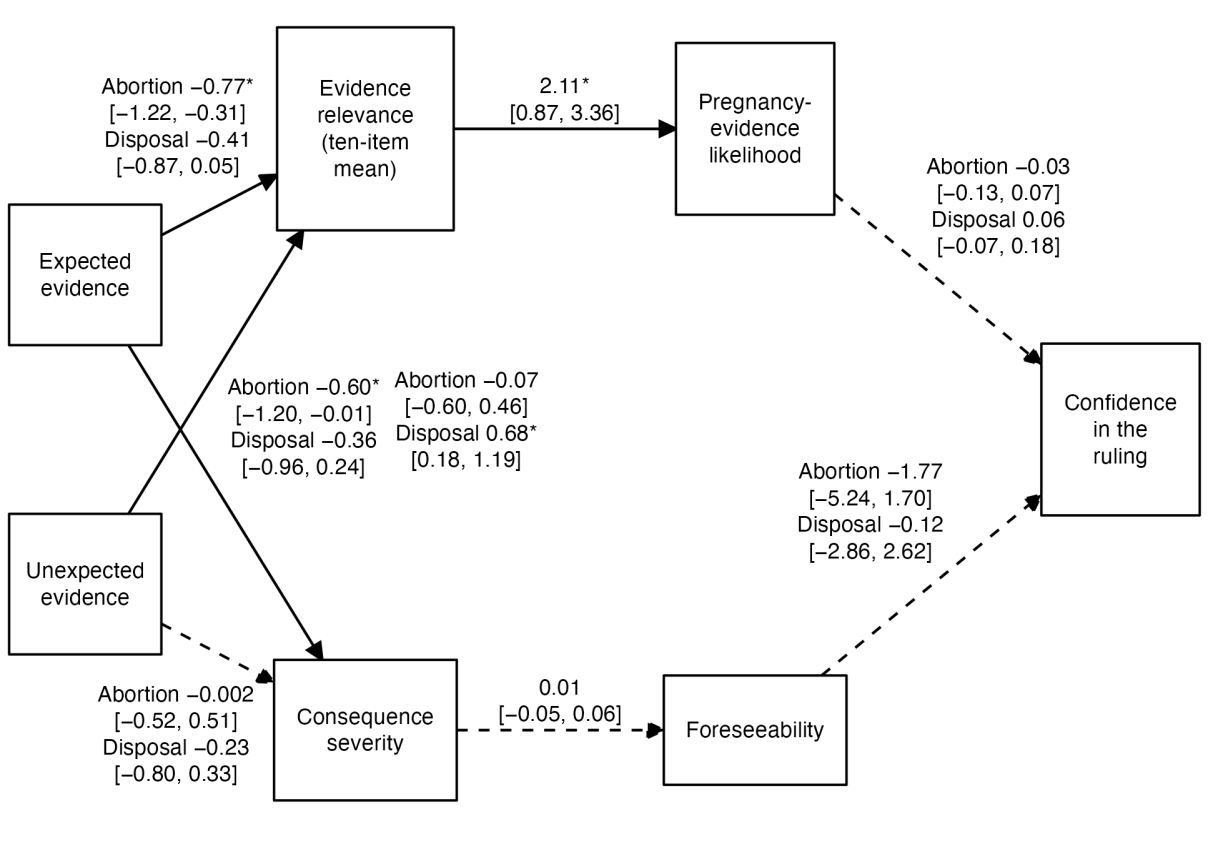
Figure S8.6

Fitted relevance and severity chains of confidence in the ruling (E12d)



Note. The figure shows the fitted registered model with the four attitudes in the primary sample. E12d covers two chains. One runs from the evidence to evidence relevance, then to pregnancy-evidence likelihood, and then to confidence in the ruling. The other runs from the evidence to consequence severity, then to foreseeability, and then to confidence. Each path shows its unstandardized estimate and robust (Huber–White) Wald 95% interval in the original units. The paths from the evidence to each mediator and the paths into confidence are estimated in each legal context and show both estimates, labeled Abortion (illegal abortion) and Disposal (improper disposal). The path from relevance to likelihood and the path from severity to foreseeability are the same in both contexts. Solid paths have intervals that exclude zero, and dashed paths have intervals that include zero. A path with two estimates is dashed only when both intervals include zero. The figure omits the direct paths, the attitude slopes, and the disturbance covariances. The path table reports the direct paths. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected

evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S8.15

Unstandardized path estimates of the relevance pathway model of confidence, by legal context

Note. Indirect effects are products of the unstandardized paths of their route, in confidence points (0–100) per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Coefficients are unstandardized, in the endpoint's units per unit of the predictor, with robust (Huber–White) normal Wald 95% intervals, as registered for the continuous endpoints. Global fit of the without attitudes: scaled $\chi^2(14) = 21.55$, $p = .088$; robust CFI = .972; robust RMSEA = .054, 90% CI [.000, .095]; SRMR = .039. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.17

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → probable-cause ruling	E13h	0.5330	[−0.0064, 1.1479]	Positive	not supported
Expected evidence → pregnancy-evidence likelihood	—	14.0074	[5.8351, 21.9513]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood	—	−4.9130	[−13.2011, 3.2933]	None	reported without a verdict
Expected evidence → foreseeability	—	0.2127	[−0.0982, 0.5203]	None	reported without a verdict
Unexpected evidence → foreseeability	—	−0.3721	[−0.6831, −0.0569]	None	reported without a verdict

Note. Registered quantities first: the endpoint slopes of likelihood and foreseeability (E13a–E13b) and the direct outcome paths (E13g–E13h); the outcome-to-mediator paths follow, reported without a registered direction. Coefficients are unstandardized, in probit units per unit of the predictor (the latent response variance is fixed at one). Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable, as registered for the probit endpoints. No item was missing. A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → foreseeability → probable-cause ruling	—	0.1223	[−0.1092, 0.4103]	None	reported without a verdict
Unexpected evidence → sum of the two indirect effects	—	0.1149	[−0.3360, 0.5958]	None	reported without a verdict
Unexpected evidence → likelihood minus foreseeability indirect effect	—	−0.1298	[−0.4622, 0.1710]	None	reported without a verdict

Note. Registered quantities first in each legal context (E13c–E13f); the other indirect effects, their sums, differences and totals, the expected-minus-unexpected comparisons and the abortion-minus-disposal differences are reported without a registered direction. Indirect effects are products of the unstandardized paths of their route, in probit units of the ruling per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. The run reports no global fit for a model with a probit endpoint (the registration names none). A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

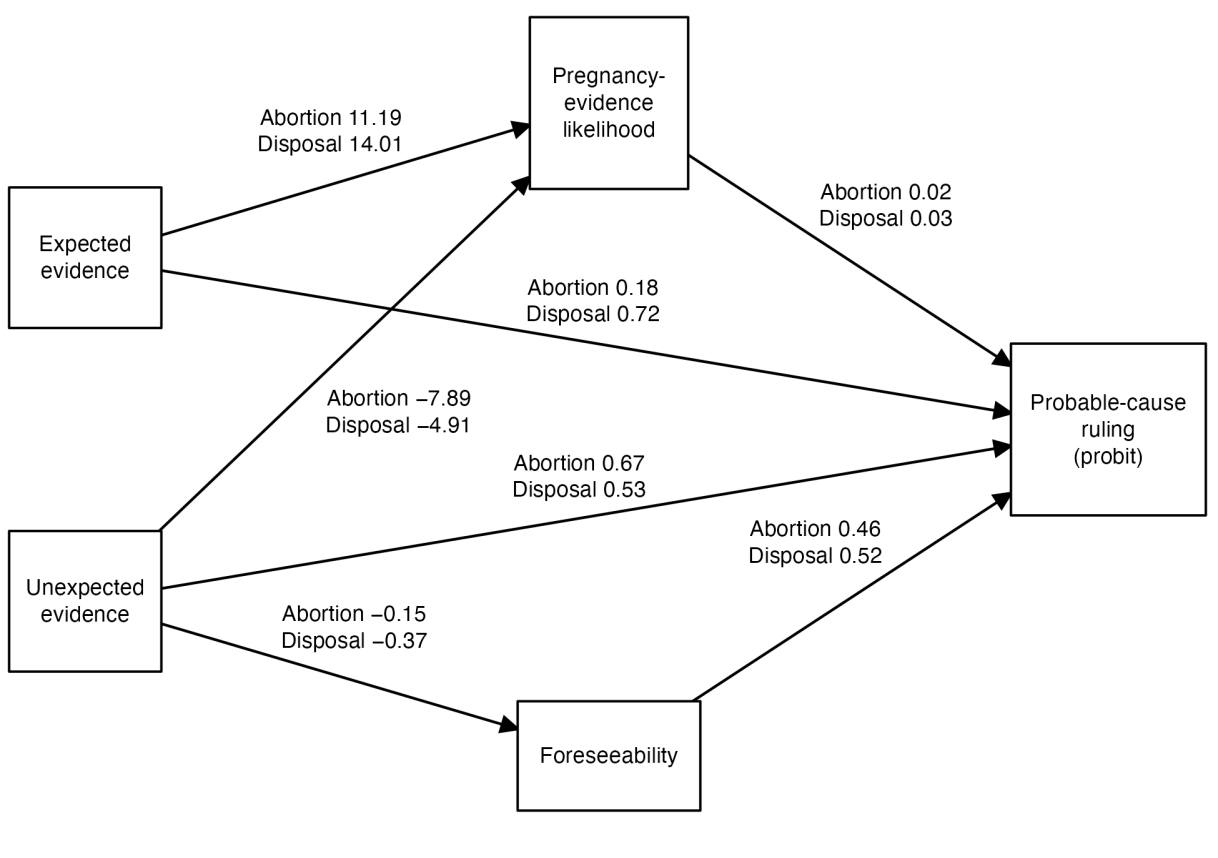
Figure S8.7

Fitted two-mediator chains of the probable-cause ruling (E13a–E13h)



Note. Fitted parallel mediation model of outcome information and the probable cause ruling in the primary sample, with likelihood and foreseeability as mediators and the four attitudes as covariates. The likelihood and foreseeability coefficients on the ruling are E13a and E13b. Indirect effects of expected and unexpected evidence through likelihood are E13c and E13d; for unexpected evidence, the indirect effect through foreseeability is E13e and the sum across both mediators is E13f. E13g and E13h are the direct effects of outcome information. Unstandardized estimates are shown separately for illegal abortion (Abortion) and improper disposal (Disposal). Estimates for paths into the ruling are in probit units; all others are in their original units. All paths are solid. The coefficient table reports registered percentile bootstrap intervals for every path, and the path table reports robust Wald intervals. The path table also includes the unlettered expected-evidence path to foreseeability, attitude slopes, and mediator-disturbance covariance omitted from the diagram. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal,

	Illegal abortion			Improper disposal			
Predictor	**b (SE)**	**95% CI**	**p**	**b (SE)**	**95% CI**	**p**	**Equal across contexts**

Note. Unstandardized estimates in the original units with robust standard errors, normal Wald 95% intervals and two-sided p (WLSMV sandwich; the endpoint paths are in probit units, with the latent response variance fixed at one). The registered intervals of the endpoint paths are the percentile bootstrap intervals of the coefficient table. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.20

Paths and indirect effects of the two-mediator model of the ruling without the attitudes (registered companion)

Quantity	Letter	Estimate	95% CI	Predicted
Illegal abortion, indirect effects				
Expected evidence → pregnancy-evidence likelihood → probable-cause ruling	E13c	0.2244	[0.0616, 0.4540]	Positive
Unexpected evidence → pregnancy-evidence likelihood → probable-cause ruling	E13d	−0.1500	[−0.3695, 0.0161]	Negative
Unexpected evidence → foreseeability → probable-cause ruling	E13e	−0.0719	[−0.2307, 0.0675]	Negative
Unexpected evidence → sum of the two indirect effects	E13f	−0.2219	[−0.5164, 0.0308]	Negative
Expected evidence → foreseeability → probable-cause ruling	—	0.1794	[0.0266, 0.4060]	None
Expected evidence → sum of the two indirect effects	—	0.4038	[0.1343, 0.7691]	None
Expected evidence → likelihood minus foreseeability indirect effect	—	0.0449	[−0.1818, 0.2753]	None
Expected evidence → total (both indirect effects and the direct path)	—	0.5498	[0.0070, 1.1471]	None

Unexpected evidence → likelihood minus foreseeability indirect effect	—	−0.1224	[−0.4323, 0.1755]	None

Note. Indirect effects are products of the unstandardized paths of their route, in probit units of the ruling per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Coefficients are unstandardized, in probit units per unit of the predictor (the latent response variance is fixed at one). Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable, as registered for the probit endpoints. Reported beside the model with attitudes; decisions are read from the model with attitudes only. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.21

Mediator and endpoint paths of the two-mediator model of confidence, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Pregnancy-evidence likelihood → confidence in the ruling	E13i	−0.033	[−0.133, 0.068]	Positive	not supported
Foreseeability → confidence in the ruling	E13j	−1.771	[−5.243, 1.701]	Positive	not supported
Expected evidence → confidence in the ruling	E13o	6.910	[0.167, 13.653]	Positive	supported
Unexpected evidence → confidence in the ruling	E13p	9.461	[3.300, 15.623]	Positive	supported
Expected evidence → pregnancy-evidence likelihood	—	11.191	[3.121, 19.261]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood	—	−7.890	[−16.325, 0.545]	None	reported without a verdict
Expected evidence → foreseeability	—	0.387	[0.063, 0.710]	None	reported without a verdict
Unexpected evidence → foreseeability	—	−0.155	[−0.450, 0.140]	None	reported without a verdict
Improper disposal					
Pregnancy-evidence likelihood → confidence in the ruling	E13i	0.056	[−0.065, 0.178]	Positive	not supported
Foreseeability → confidence in the ruling	E13j	−0.122	[−2.858, 2.615]	Positive	not supported

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Expected evidence → confidence in the ruling	E13o	3.272	[−3.522, 10.066]	Positive	not supported
Unexpected evidence → confidence in the ruling	E13p	−2.555	[−9.464, 4.354]	Positive	not supported
Expected evidence → pregnancy-evidence likelihood	—	14.007	[6.126, 21.889]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood	—	−4.913	[−13.147, 3.321]	None	reported without a verdict
Expected evidence → foreseeability	—	0.213	[−0.091, 0.516]	None	reported without a verdict
Unexpected evidence → foreseeability	—	−0.372	[−0.675, −0.069]	None	reported without a verdict

Note. Registered quantities first: the endpoint slopes of likelihood and foreseeability (E13i–E13j) and the direct outcome paths (E13o–E13p); the outcome-to-mediator paths follow, reported without a registered direction. Coefficients are unstandardized, in the endpoint's units per unit of the predictor, with robust (Huber–White) normal Wald 95% intervals, as registered for the continuous endpoints. A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Quantity	Letter	Estimate	95% CI	Predicted	Decision

Note. Registered quantities first in each legal context (E13k–E13n); the other indirect effects, their sums, differences and totals, the expected-minus-unexpected comparisons and the abortion-minus-disposal differences are reported without a registered direction. Indirect effects are products of the unstandardized paths of their route, in confidence points (0–100) per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. The model has as many parameters as observed moments, so it has no global fit. A letter is supported in a legal context when its interval lies on the predicted side of zero. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

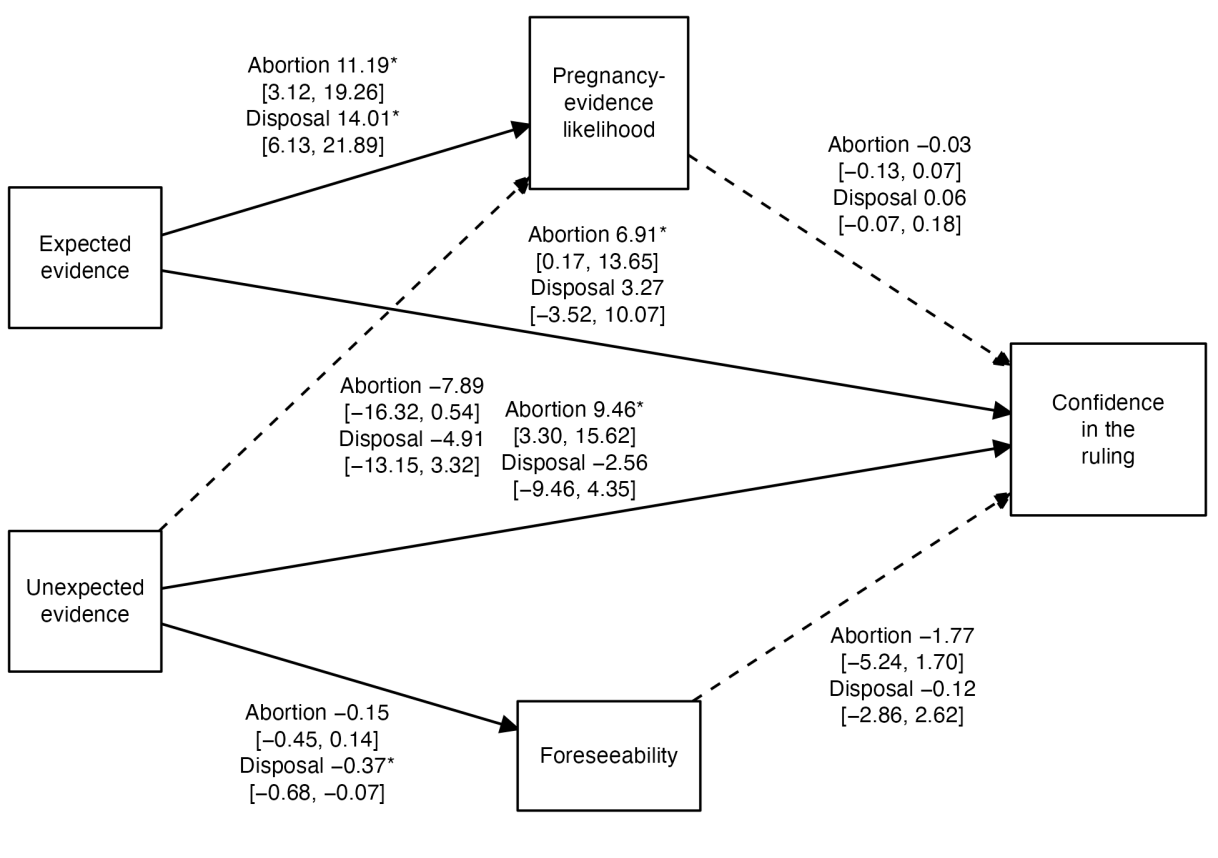
Figure S8.8

Fitted two-mediator chains of confidence in the ruling (E13i–E13p)



Note. Fitted parallel mediation model of outcome information and confidence in the ruling in the primary sample, with likelihood and foreseeability as mediators and the four attitudes as covariates. The likelihood and foreseeability coefficients on confidence are E13i and E13j. Indirect effects of expected and unexpected evidence through likelihood are E13k and E13l; for unexpected evidence, the indirect effect through foreseeability is E13m and the sum across both mediators is E13n. E13o and E13p are the direct effects of outcome information. Each path has an unstandardized estimate and robust (Huber–White) Wald 95% interval in the original units for illegal abortion (Abortion) and improper disposal (Disposal). Solid lines indicate that an interval excludes zero in at least one legal context; dashed lines indicate that both intervals include zero. The path table reports the unlettered expected-evidence path to foreseeability, attitude slopes, and mediator-disturbance covariance, which are omitted from the diagram. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66

Unexpected evidence → foreseeability → confidence in the ruling	—	0.397	[−1.007, 1.966]	None
Unexpected evidence → sum of the two indirect effects	—	0.887	[−0.679, 2.615]	None
Unexpected evidence → likelihood minus foreseeability indirect effect	—	0.094	[−2.211, 2.371]	None

Note. Indirect effects are products of the unstandardized paths of their route, in confidence points (0–100) per outcome contrast; the abortion-minus-disposal rows are differences of those products. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Coefficients are unstandardized, in the endpoint's units per unit of the predictor, with robust (Huber–White) normal Wald 95% intervals, as registered for the continuous endpoints. Reported beside the model with attitudes; decisions are read from the model with attitudes only. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.25

Likelihood thresholds for finding probable cause and their inverted threshold sets, by condition and legal context

Condition	Threshold	Curve	Inverted threshold set
Illegal abortion			
No information	43.6	rises to one half within the rating range	expected: [24.8, 62.4]; unexpected: [23.0, 64.2]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Condition	Threshold	Curve	Inverted threshold set
Expected evidence	56.9	rises to one half within the rating range	[14.7, 99.2]
Unexpected evidence	36.3	rises to one half within the rating range	[0.0, 80.1]; may not exist
Improper disposal			
No information	54.6	rises to one half within the rating range	expected: [21.2, 87.7]; unexpected: [31.0, 78.0]
Expected evidence	23.0	rises to one half within the rating range	[0.0, 53.8]; may not exist
Unexpected evidence	35.9	rises to one half within the rating range	[2.5, 69.2]

Note. Threshold: the likelihood rating (offense-matched, on the rating scale) at which the condition's average predicted probability of finding probable cause first rises to one half, from the registered model with the four attitudes. Inverted threshold set: the ratings at which the joint band of the comparison contains one half on a rising curve; a set is a union of intervals, and a set that may not exist is marked. The no-information curve belongs to both comparisons of its context, so it has one set per comparison. Joint 95% percentile bootstrap band (type 6) across the two curves of each comparison, from 10,000 participant resamples stratified within the six conditions, 9,983 usable; its half-width is the 95th quantile of the largest deviation of either bootstrap curve from its original curve over the rating range. Reported without a verdict (no registered decision rule). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S8.26

Differences between the likelihood threshold after each incriminating outcome and after no information, by legal context

Comparison	Difference	Band half-width	Difference set	May be undefined	Excludes zero
Illegal abortion					
Expected evidence	13.3	0.253	[−47.7, 74.4]	No	No

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Difference	Band half-width	Difference set	May be undefined	Excludes zero
minus no information					
Unexpected evidence minus no information	−7.3	0.273	[−64.2, 57.1]; may not exist	Yes	not assessed
Improper disposal					
Expected evidence minus no information	−31.6	0.285	[−87.7, 32.6]; may not exist	Yes	not assessed
Unexpected evidence minus no information	−18.7	0.212	[−75.5, 38.2]	No	No

Note. Difference: the incriminating outcome's threshold minus the no-information threshold, in rating points; undefined when either curve has no threshold. Difference set: every difference of a component of the one inverted set and a component of the other, disconnected components kept. Excludes zero is assessed only for a definitive production run whose difference is defined. Joint 95% percentile bootstrap band (type 6) across the two curves of each comparison, from 10,000 participant resamples stratified within the six conditions, 9,983 usable; its half-width is the 95th quantile of the largest deviation of either bootstrap curve from its original curve over the rating range. Reported without a verdict (no registered decision rule). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

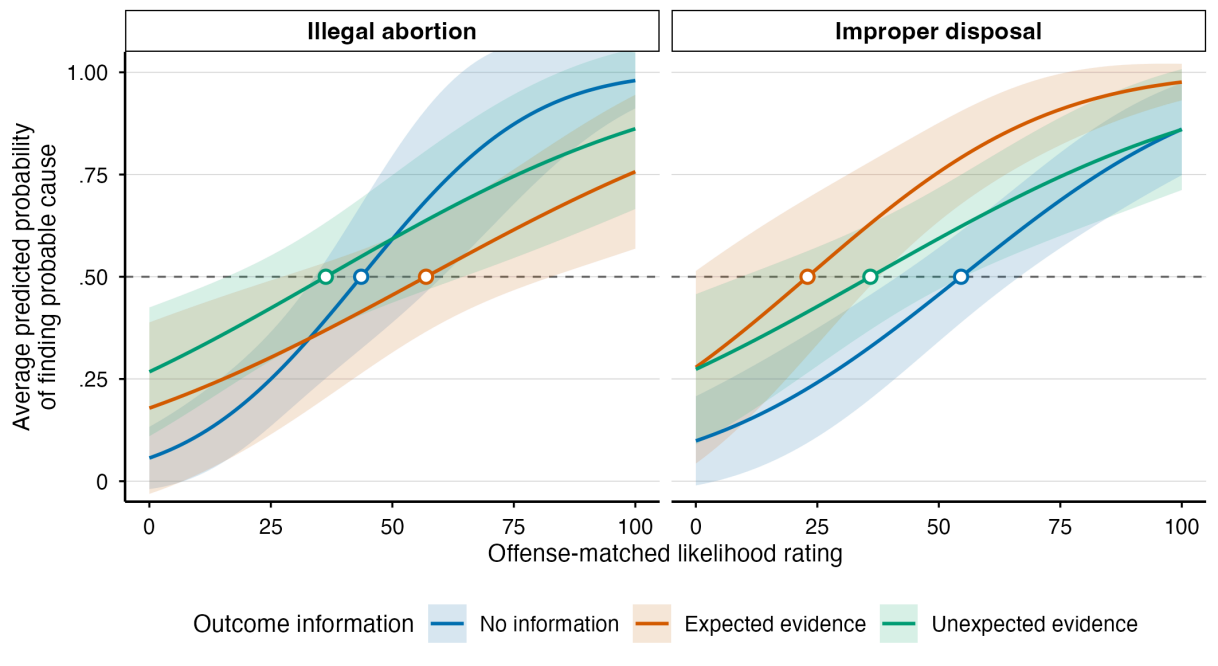
Figure S8.9

Average predicted probability of finding probable cause across the likelihood rating, by condition, one panel per legal context



Note. Predicted probability of finding probable cause by likelihood rating and outcome condition, from the registered threshold model with the four attitudes in the primary sample. I averaged predictions over participants within each legal context at each outcome-by-likelihood combination. The dashed .50 line identifies the threshold probability, and an open circle marks the likelihood rating where a curve crosses it. Shading gives pointwise 95% delta-method intervals from the robust covariance, cut at 0 and 1. I used the registered joint band to obtain the threshold sets in the tables; the shaded pointwise intervals do not define those sets. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S8.27

Likelihood thresholds and their differences without the attitudes (registered companion)

Condition or comparison	Threshold or difference	Inverted set
Illegal abortion, thresholds		

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Condition or comparison	Threshold or difference	Inverted set
No information	42.7	expected: [27.0, 58.5]; unexpected: [25.9, 59.5]
Expected evidence	56.3	[23.4, 89.2]
Unexpected evidence	35.7	[0.0, 71.6]; may not exist
Improper disposal, thresholds		
No information	55.0	expected: [24.1, 86.0]; unexpected: [30.0, 80.0]
Expected evidence	27.1	[2.3, 52.0]
Unexpected evidence	39.0	[4.2, 73.9]
Illegal abortion, differences		
Expected evidence minus no information	13.6	[−35.1, 62.2]
Unexpected evidence minus no information	−7.0	[−59.5, 45.6]; may not exist
Improper disposal, differences		
Expected evidence minus no information	−27.9	[−83.7, 27.9]
Unexpected evidence minus no information	−16.0	[−75.9, 43.8]

Note. The registered companion without attitudes; thresholds, sets and differences as in the tables of the registered model. Joint 95% percentile bootstrap band (type 6) across the two curves of each comparison, from 10,000 participant resamples stratified within the six conditions, 9,983 usable; its half-width is the 95th quantile of the largest deviation of either bootstrap curve from its original curve over the rating range. Reported without a verdict (no registered decision rule). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

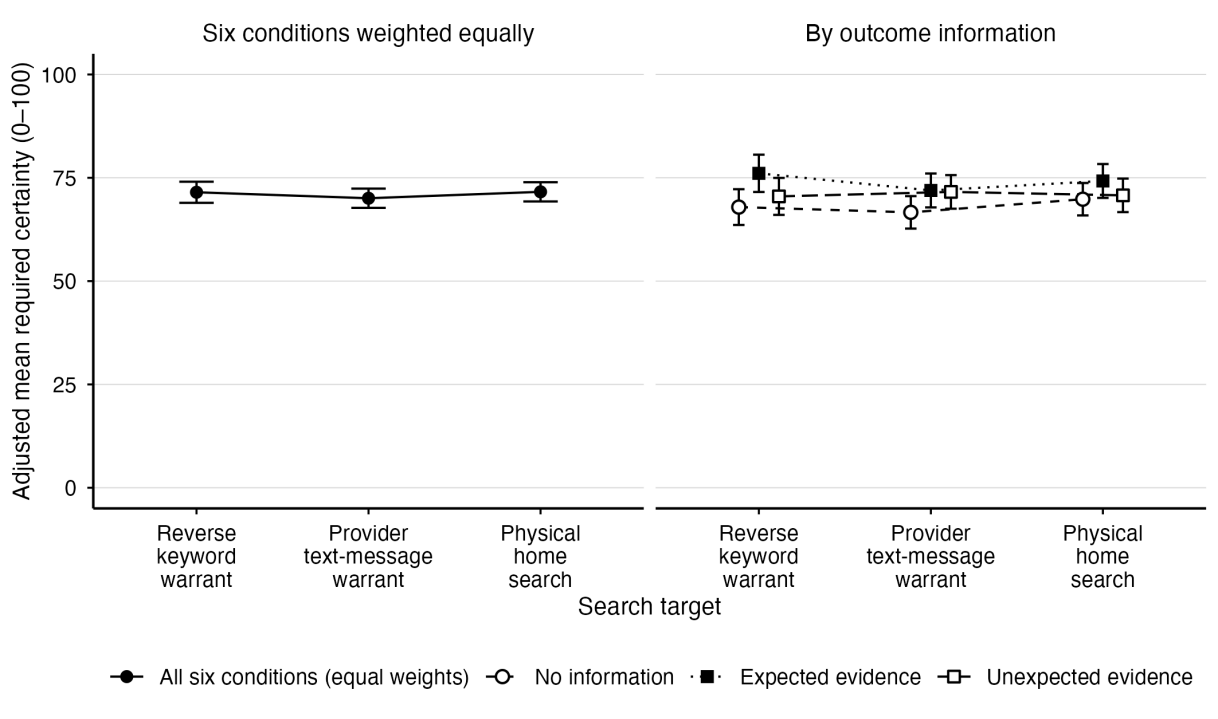
S9. RQ5: exploratory analyses

Figure S9.1

Adjusted mean certainty required for each search target, overall and by outcome information



Note. Adjusted mean certainty required for each search target from the joint model of the three certainty ratings, with attitudes at their primary-sample means. The left panel compares the targets overall, with adjacent differences corresponding to H5a and H5b. In the right panel, the two legal contexts have equal weight within each outcome condition. Error bars represent two-sided 95% *t* confidence intervals for the means, based on the model's residual degrees of freedom. The interval calculation combines the joint model covariance and the sampling covariance of the attitude means, as in the registered comparisons. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Comparison	Letter	Predicted	Difference	95% CI	Decision

Note. Comparisons of adjusted means from the saved joint model of the three certainty ratings. Within each target: the four conditions with expected or unexpected evidence (weights one quarter) against the two no-information conditions (weights minus one half), and each pair of outcome conditions with the legal contexts averaged equally. First block: each adjacent-target difference in the illegal-abortion minus the improper-disposal context (outcome conditions weighted equally), and after expected minus after unexpected evidence (legal contexts weighted equally). Intervals: two-sided 95% t intervals on 388 degrees of freedom, with the standard error of each comparison taken from the model covariance plus the sampling covariance of the attitude means (the estimated attitude reference, as registered). No model variable was missing, so no values were imputed. Predicted = the registered sign; rows without a letter have no registered direction and are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Required certainty is rated on the 0–100 scale; means and differences are in scale points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S9.2

Associations of the four attitudes with the certainty required for each search target

	Reverse keyword warrant		Provider text-message warrant		Physical home search	
Attitude	**b**	**95% CI**	**b**	**95% CI**	**b**	**95% CI**
Abortion attitudes	−0.041	[−0.173, 0.092]	−0.032	[−0.152, 0.088]	−0.081	[−0.202, 0.039]
Support for punishment	−0.593	[−2.703, 1.518]	−0.300	[−2.213, 1.614]	−0.733	[−2.644, 1.178]
Hostile sexism	0.242	[−2.252, 2.736]	0.625	[−1.637, 2.886]	−0.923	[−3.181, 1.335]
Benevolent sexism	−0.981	[−3.518, 1.557]	−2.386	[−4.686, −0.085]	1.057	[−1.241, 3.354]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	Reverse keyword warrant		Provider text-message warrant		Physical home search	
Attitude	**b**	**95% CI**	**b**	**95% CI**	**b**	**95% CI**

Note. Unstandardized slopes of required certainty on each attitude within each target, from the saved joint model (the four attitudes entered together, with the six condition intercepts of each target). Scale points of certainty per point of the attitude: abortion attitudes (14–98, the item sum), support for punishment (1–7), hostile and benevolent sexism (0–5). Reported without a verdict (no registered direction). Intervals: two-sided 95% t intervals on 388 degrees of freedom (each slope is a coefficient of the model; no attitude reference enters it). No model variable was missing, so no values were imputed.

Table S9.3

Clustering of the certainty ratings within participants and the comparison of two covariance structures

Quantity	Value	df	p	n
Intraclass correlation (unconditional random-intercept model)	0.611			398
Between-participant variance	365.67			398
Residual (within-participant) variance	232.71			398
REML likelihood ratio: compound symmetry against the unrestricted covariance	18.49	4	< .001	398

Note. Descriptive only, as registered; neither step changes the registered model or its decisions. The intraclass correlation is the between-participant share of the variance of the three ratings in an intercept-only model with a random participant intercept (REML). The likelihood ratio compares, by REML with the registered fixed effects (target-specific condition intercepts and attitude slopes), a random-intercept (compound symmetry) covariance of the three ratings with the unrestricted covariance of the registered model; df = the difference in covariance parameters. n = participants with all three certainty ratings and complete attitudes. Variances are in squared scale points of the 0–100 scale.

Comparison	Letter	Predicted	Difference	95% CI	Decision

Note. Differences between average predicted probabilities of approval from the saved logistic GEE (target by outcome by legal context, four common attitude slopes), every participant of the sample predicted in each condition with that participant's own attitudes. Adjacent targets: the six conditions weighted equally. Within each target: each pair of outcome conditions with the legal contexts averaged equally; the legal contexts compared with the outcome conditions weighted equally; and the effect of each kind of evidence compared between the legal contexts. Intervals: two-sided 95% t intervals on 376 degrees of freedom, on the participant sandwich covariance of the GEE (working independence) with the small-sample factor N/(N – p); for the average predicted probabilities, the participant influence functions add the variation of the participants' own predictions. No model variable was missing, so no values were imputed. Predicted = the registered sign; rows without a letter have no registered direction and are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Differences of average predicted probabilities are in percentage points. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

		Log odds		Odds ratio		Probability slope		
Predictor	**Letter**	**b**	**95% CI**	**OR**	**95% CI**	**pp**	**95% CI**	**Decision**
Benevolent sexism	—	0.024	[−0.161, 0.209]	1.024	[0.851, 1.233]	0.49	[−3.30, 4.27]	reported without a verdict
Search approval with target-matched likelihood (E15f)								
Target-matched likelihood (per ten points)	E15f	0.300	[0.229, 0.371]	1.350	[1.257, 1.449]	5.54	[4.40, 6.69]	supported
Abortion attitudes	—	0.003	[−0.008, 0.013]	1.003	[0.992, 1.013]	0.05	[−0.14, 0.24]	reported without a verdict
Support for punishment	—	0.398	[0.230, 0.566]	1.489	[1.258, 1.761]	7.35	[4.47, 10.24]	reported without a verdict
Hostile sexism	—	0.177	[−0.008, 0.362]	1.194	[0.992, 1.437]	3.27	[−0.12, 6.66]	reported without a verdict
Benevolent sexism	—	0.030	[−0.164, 0.224]	1.030	[0.849, 1.251]	0.55	[−3.03, 4.14]	reported without a verdict

Note. Log-odds slopes of the saved logistic GEEs, their odds ratios and their average local probability slopes (the derivative of each participant's predicted probability over the participant's own intended targets, averaged over participants). The likelihood slope is per ten points of the target-matched rating and is common to the three targets and six conditions; the attitude slopes are common to the targets. Only E15f carries a registered direction; the attitude slopes are reported without a verdict. Intervals: two-sided 95% t intervals on 376 degrees of freedom (the model of E15d–E15e) and 375 (the likelihood model), on each GEE's participant sandwich covariance (working independence) with the small-sample factor N/(N − p); for the probability slopes, the participant influence functions add the variation of the participants' own predictions. No model variable was missing, so no values were imputed. pp = percentage points per point of the attitude or per ten points of likelihood. The odds-ratio interval exponentiates the log-odds interval. A letter is supported when its interval lies on the predicted side of zero. Target-matched likelihood is rated on the 0–100 scale; the likelihood slope is per ten points of that scale.

Table S9.6

Target-matched likelihood rating at which approval of each search target becomes more likely than not (E15g)

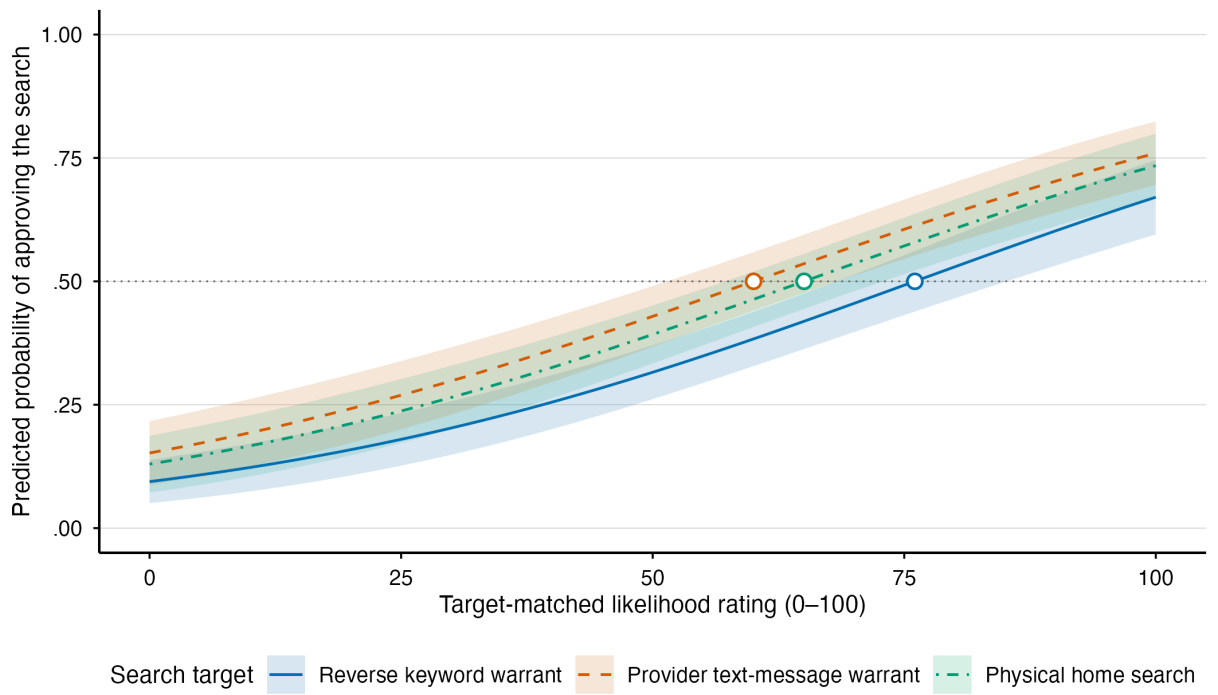
Target	Threshold	95% CI	Curve	Resamples	Rank	Decision
Reverse keyword warrant	76.06	[68.10, 85.09]	crosses one half inside the scale	10,000 of 10,000 with a crossing	3	reported without a verdict
Provider text-message warrant	60.03	[51.08, 68.58]	crosses one half inside the scale	10,000 of 10,000 with a crossing	1	reported without a verdict
Physical home search	65.05	[56.86, 73.18]	crosses one half inside the scale	10,000 of 10,000 with a crossing	2	reported without a verdict

Note. Threshold: the likelihood rating (0–100 scale) at which the average predicted probability of approval of the target in the saved E15f model is one half, the six conditions weighted equally and the attitudes at their pooled means; none when the curve does not cross one half inside the scale. Rank orders the thresholds found, lowest first. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples, 10,000 attempted, each interval computed only from the resamples in which the curve crossed one half. Resamples: the number of usable resamples in which the curve crossed one half, of those attempted; no interval is given without a threshold or with fewer than two crossings. No model variable was missing, so no values were imputed. Reported without a verdict (no registered decision rule; the registration explores whether the thresholds rise from reverse keyword warrants to physical home searches).

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Figure S9.2

Predicted probability of approving each search target across the target-matched likelihood rating, with the approval thresholds



Note. Predicted probabilities of approving each search target from the primary-sample generalized estimating equation model (E15f). Predictions average across the six conditions, weighted equally at each value on a fixed likelihood grid, with attitudes at their pooled means. Shaded regions represent two-sided 95% *t* confidence intervals, calculated by the delta method using the participant sandwich covariance multiplied by $N/(N - p)$. An open circle marks the likelihood rating at which approval probability crosses .50 (E15g). A target has no threshold if its curve does not cross .50. The likelihood slope, the thresholds, and their intervals are in the tables.

Quantity	Letter	Predicted	Estimate	SE	z	p	95% CI	Decision

Note. Interactions: the change in the difference between each kind of evidence and no information per point of abortion attitudes, a coefficient of the model, with its heteroskedasticity-consistent (HC3) standard error and normal Wald 95% interval. Differences at the three attitude levels: the adjusted difference between expected evidence and no information, legal contexts averaged equally, at the attitude mean of the model's participants and one standard deviation (SD) above and below it; their standard errors add the sampling covariance of that mean and SD to the HC3 covariance. z and p from the same standard error; no adjustment for multiple comparisons. The interaction slopes are shared by the two legal contexts (the registered model). Predicted = the registered sign; the unexpected-evidence interaction and the differences at the three attitude levels have no registered direction and are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Pregnancy-evidence likelihood is in points on the 0–100 scale, foreseeability on the 1–5 scale and decision quality on the 1–7 scale; abortion attitudes are in points of their total score, centered at the mean of the participants in each model. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

for punishment, hostile sexism, and benevolent sexism are held at the means of the participants in each model. Bands are pointwise 95% delta-method intervals of each predicted level. The registered interactions and the differences at the three attitude levels, with their intervals, are in the table above. The curves reproduce those differences exactly. Dotted lines mark the mean attitude and 1 *SD* below and above it. Pregnancy-evidence likelihood is on the 0–100 scale, foreseeability is on the 1–5 scale, and decision quality is on the 1–7 scale. Abortion attitudes are in points of the total score, centered at the mean of the participants in each model. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table S10.2

Unexpected evidence × abortion attitudes, improper disposal	−0.003	0.012	−0.26	.796	[−0.026, 0.020]

Note. The same quantities as the table above, from the analyses of covariance with the abortion-attitude slope estimated in each of the six conditions: the context-averaged interactions and differences, then each interaction within each legal context. Interactions within a context carry their HC3 standard errors and normal Wald 95% intervals; the context-averaged rows are formed as in the registered model. Reported to show whether the E16 comparisons depend on slopes shared by the contexts; reported without a verdict. Pregnancy-evidence likelihood is in points on the 0–100 scale, foreseeability on the 1–5 scale and decision quality on the 1–7 scale; abortion attitudes are in points of their total score, centered at the mean of the participants in each model. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Unexpected evidence × abortion attitudes	−0.0002	0.009	−0.02	.983	[−0.018, 0.017]

Note. Unstandardized coefficients of each saved model with HC3 standard errors, z tests and normal Wald 95% intervals. Each intercept is the model's prediction in its condition with abortion attitudes at the mean of the model's participants and the other three attitudes at zero; the abortion-attitude slope is the slope after no information, and each interaction is the difference between that slope after the evidence and after no information. R^2 of each model is in the models table. Reported without a verdict. Pregnancy-evidence likelihood is in points on the 0–100 scale, foreseeability on the 1–5 scale and decision quality on the 1–7 scale; abortion attitudes are in points of their total score, centered at the mean of the participants in each model. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S10.4

Indirect and total associations of hostile and benevolent sexism with suspect punishment, and the routing differences

Quantity	Letter	Predicted	Estimate	95% CI	Decision
Hostile sexism					
Indirect, through support for punishment	—	None	0.212	[0.134, 0.299]	reported without a verdict
Indirect, through abortion attitudes	—	None	0.119	[0.049, 0.197]	reported without a verdict
Total (sum of the two indirect associations)	E17a	Positive	0.332	[0.242, 0.427]	supported
Routing: through support for punishment minus through abortion attitudes	E17c	Positive	0.093	[−0.032, 0.222]	not supported
Benevolent sexism					
Indirect, through support for punishment	—	None	0.120	[0.061, 0.190]	reported without a verdict
Indirect, through abortion attitudes	—	None	0.055	[0.015, 0.111]	reported without a verdict
Total (sum of the two indirect associations)	E17b	Positive	0.175	[0.098, 0.264]	supported
Routing: through abortion attitudes minus through support for punishment	E17d	Positive	−0.065	[−0.148, 0.012]	not supported

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Quantity	Letter	Predicted	Estimate	95% CI	Decision

Note. Indirect associations are products of the unstandardized sexism-to-mediator and mediator-to-punishment paths; totals sum the two indirect associations of a sexism score; routing differences subtract them as registered. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Predicted = the registered sign: the totals are expected to be positive, hostile sexism to run more through support for punishment and benevolent sexism more through abortion attitudes. The four specific indirect associations are reported without a verdict. A letter is supported when its interval lies on the predicted side of zero. Suspect punishment is rated on the 1–7 scale; the indirect and total associations are in suspect-punishment points per point of the sexism score.

Table S10.5

The registered E17 family line (supported only if all four E17 letters are supported)

Letters	Condition	Family line
E17a, E17b, E17c, E17d	all conditions met: hostile:total, benevolent:total, hostile:routing and benevolent:routing each supported	the E17 routing pattern is not supported

Note. Printed from the saved model output (the supplement's E17 sentence, "All of these conditions will need to be met for E17a–E17d to be supported"), reported beside the per-letter decisions above as one family line; it is not one of the registered decision rules.

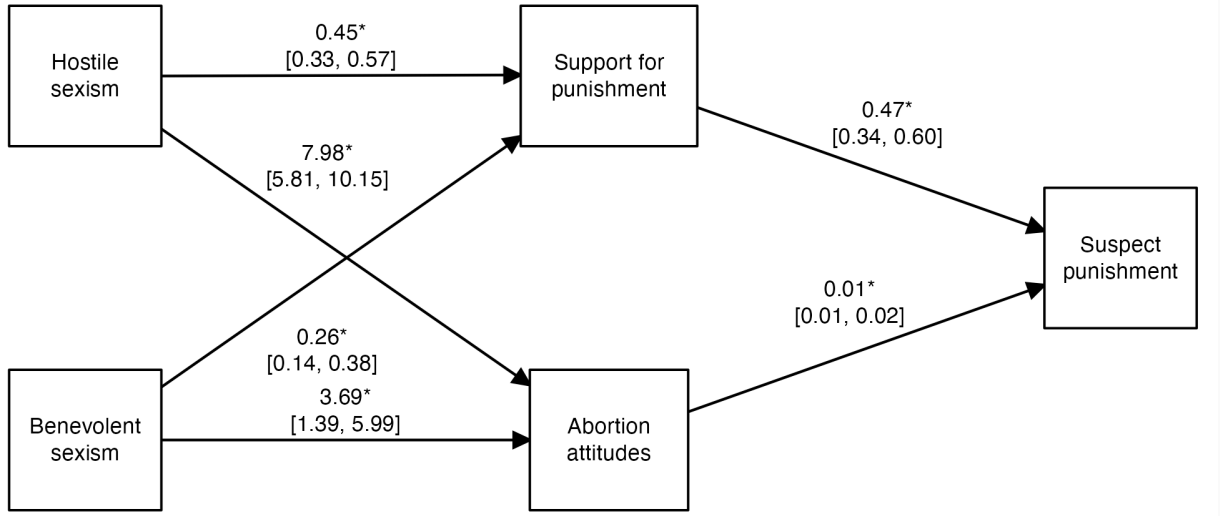
Figure S10.2

Fitted sexism, attitude and suspect-punishment chains (E17a–E17d)



Note. The figure shows the fitted single-group path model in the primary sample. E17a–E17d run from hostile and benevolent sexism through support for punishment and abortion attitudes to suspect punishment. E17a and E17b are the total indirect effects of each sexism score (i.e., the sum of its two routes). E17c and E17d are the differences between the two routes of each score. Each path shows its unstandardized estimate and robust (Huber–White) Wald 95% interval in the original units. Solid paths have intervals that exclude zero, and dashed paths have intervals that include zero. The figure omits the outcome-information and legal-context covariates of suspect punishment, the covariance of the two sexism scores, and the covariance of the mediator disturbances. The path table reports them. The indirect effects are products of the paths and appear in the indirect-effect table.

Table S10.6

Unstandardized and standardized path estimates of the E17 model

Predictor	b (SE)	95% CI	p	β
Predicting support for punishment				
Hostile sexism	0.454 (0.061)	[0.335, 0.573]	< .001	0.400

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Predictor	b (SE)	95% CI	p	β
Benevolent sexism	0.257 (0.062)	[0.135, 0.379]	< .001	0.205
Predicting abortion attitudes				
Hostile sexism	7.982 (1.108)	[5.810, 10.155]	< .001	0.436
Benevolent sexism	3.690 (1.173)	[1.390, 5.990]	.002	0.182
Predicting suspect punishment				
Support for punishment	0.467 (0.066)	[0.338, 0.597]	< .001	0.366
Abortion attitudes	0.015 (0.004)	[0.007, 0.023]	< .001	0.189
Expected evidence	1.085 (0.194)	[0.705, 1.465]	< .001	0.260
Unexpected evidence	0.374 (0.207)	[−0.032, 0.780]	.071	0.090
Improper disposal (legal context)	0.351 (0.164)	[0.029, 0.673]	.033	0.090
Covariances				
Support for punishment with abortion attitudes	9.235 (1.486)	[6.323, 12.147]	< .001	0.348
Hostile sexism with benevolent sexism	0.831 (0.087)	[0.660, 1.001]	< .001	0.509

Note. Unstandardized estimates in the original units with robust (Huber–White) standard errors, normal Wald 95% intervals and two-sided p. The mediator disturbances covary freely and neither covaries with the disturbance of suspect punishment, as registered; the covariances of the sexism scores with the outcome and legal-context covariates, and among those covariates, are estimated but not printed. β = supplementary standardized estimate (std.all); inference and decisions use the unstandardized estimates. Expected evidence and unexpected evidence are each coded against no information; improper disposal against illegal abortion. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table S10.7

Global fit and variance explained of the E17 model

Quantity	Value
χ^2 (robust, scaled)	8.17, df = 8, p = .417
CFI (robust)	1.000
RMSEA (robust) [90% CI]	.008 [.000, .060]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Quantity	Value
SRMR	.019
R^2, support for punishment	.285
R^2, abortion attitudes	.304
R^2, suspect punishment	.307

Note. Global fit indices are the robust indices of the fitted models; R^2 of each endogenous variable from the fitted model. R^2 does not depend on the fitting scale. Reported without a verdict (the registration sets no fit criterion for E17). RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).

Letter and target	Analysis	Primary sample Estimate	Primary sample 95% CI	Sensitivity sample Estimate	Sensitivity sample 95% CI	Interval

Note. The pooled estimates of the letters the registered legal-context rule moves (H1a–H1i, H2a–H2b and H4b–H4d), each the target that letter's rule would read under the pooled set, from the registered model (the legal-contexts-pooled version of a structural model; the contexts-pooled comparison of an analysis of covariance, with the Outcome × Legal Context interaction retained). The rule made the grouped set primary, so these estimates carry no verdict. Interval: the saved interval procedure of the row (percentile bootstrap for indirect effects, normal Wald for coefficients, Student t for the analyses of covariance); 95% intervals throughout. Percentile-bootstrap resamples behind the bootstrap intervals of this table, over the attempt records of its analyses: primary sample, 10,000 attempted and 10,000 usable; sensitivity sample, 10,000 attempted and 10,000 usable. Each record is in the table of bootstrap attempts in S13. Prefixes Ab and Di name the illegal-abortion and improper-disposal contexts, pooled the legal contexts pooled, Ab_minus_Di or Ab_Di their difference; no prefix, the contexts averaged with equal weights. XS and SMA = expected evidence, XF and Financial = unexpected evidence, None = no information; A_B = A minus B. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

S13. The sensitivity sample

Table S13.1

Participants in each condition of the primary and sensitivity samples

	n		
Condition	**Primary sample**	**Sensitivity sample**	**Not retained**
Illegal abortion, no information	68	55	13
Illegal abortion, expected evidence	63	56	7
Illegal abortion, unexpected evidence	63	54	9
Improper disposal, no information	71	56	15
Improper disposal, expected evidence	66	62	4
Improper disposal, unexpected evidence	67	58	9
All conditions	398	341	57

Note. Counts from the analysis sample; the sensitivity sample is the primary sample minus the participants the registered sensitivity exclusions remove. Not retained: 57 failed or skipped the outcome manipulation check and 0 completed the study in less than one-third of the median completion time (0 both). Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.

Table S13.2

Attempted and usable percentile-bootstrap resamples of every bootstrap analysis in each sample

	Primary sample			Sensitivity sample		
Record	**Attempted**	**Usable**	**Minimum**	**Attempted**	**Usable**	**Minimum**
RQ1: hindsight pathways and likelihood judgments						
Hindsight pathways (rq1-explanatory): all versions (one attempt record)	10,000	10,000	met	10,000	10,000	met
RQ2: the detective and the warrant decision						
Exploratory decision-quality	10,000	10,000	met	10,000	10,000	met

	Primary sample			Sensitivity sample		
Record	**Attempted**	**Usable**	**Minimum**	**Attempted**	**Usable**	**Minimum**
(rq4-relevance-pc): all versions (one attempt record)						
Relevance pathways to confidence (rq4-relevance-confidence): all versions (one attempt record)	10,000	10,000	met	10,000	10,000	met
Relevance pathways to scalar probable cause–confidence (rq4-relevance-signed): all versions (one attempt record)	10,000	10,000	met	10,000	10,000	met
Hindsight pathways to probable cause (rq4-simple-pc): all versions (one attempt record)	10,000	10,000	met	10,000	10,000	met
Hindsight pathways to confidence (rq4-simple-confidence): all versions (one attempt record)	10,000	10,000	met	10,000	10,000	met
Original-search decision threshold (rq4-threshold): all versions (one attempt record)	10,000	9,983	met	10,000	9,981	met
RQ5: judgments across search targets						
Search-target decision thresholds (targets-thresholds): Home	10,000	10,000	met	10,000	10,000	met

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	Primary sample			Sensitivity sample		
Record	**Attempted**	**Usable**	**Minimum**	**Attempted**	**Usable**	**Minimum**
threshold, finite crossings						
Search-target decision thresholds (targets-thresholds): Keyword threshold, finite crossings	10,000	10,000	met	10,000	10,000	met
Search-target decision thresholds (targets-thresholds): Message threshold, finite crossings	10,000	10,000	met	10,000	10,000	met
RQ6: abortion attitudes, sexism and punishment						
Sexism, attitudes and punishment (rq6-sexism-punishment): all versions (one attempt record)	10,000	10,000	met	10,000	10,000	met

Note. Each row is one record of bootstrap attempts: one record for all versions of a structural or threshold model (an attempt is usable only when every version succeeds), or a record per version of the other bootstrap analyses; for the search-target thresholds (E15g), the usable resamples that cross the threshold. Usable = attempted minus failed. Minimum: met when usable reaches the minimum of 9,500 (the registered rule for a decision); below it the analysis is incomplete and its intervals carry no decision. Analyses without a bootstrap (the analyses of covariance, the repeated-measures and multilevel models, the generalized estimating equations and the moderation models) have no attempt record.

Note. One row per letter and per target its registered decision rule reads under the primary legal-context set, with the estimate and interval of the table that rule reads; decimals follow each row's magnitude. A directional letter is supported when its interval lies on the predicted side of zero, an equivalence letter when its interval lies inside the registered bounds. Verdict differs: yes when the two samples give different verdicts (supported, not supported); — when either sample gives none (unavailable, reported without a verdict, or suppressed). No test compares the samples. H3c, H3d, H3e: substitute mediator: pregnancy-evidence likelihood; deviation 2 in S1. Each row's interval uses its letter's registered procedure. Prefixes Ab and Di name the illegal-abortion and improper-disposal contexts, pooled the legal contexts pooled, Ab_minus_Di or Ab_Di their difference; no prefix, the contexts averaged with equal weights. XS and SMA = expected evidence, XF and Financial = unexpected evidence, None = no information; A_B = A minus B. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

Note. Every saved comparison of each registered version of the RQ1 analyses, in each sample; each band is one analysis and version (registered model = the model the decision rules read; the other versions are its registered companions). Decimals follow each row's magnitude. n = the participants in the model of that version and sample. 95% intervals by each row's saved procedure (Interval): percentile bootstrap (participant resamples, stratified within the six conditions); Wald from the robust or heteroskedasticity-consistent (HC3) covariance, or from the joint normal maximum-likelihood covariance; Student t or Satterthwaite t for the linear models; — where the saved comparison has no interval (E14a's threshold differences, whose confidence sets are in its own files). No test compares the samples. Percentile-bootstrap resamples behind the bootstrap intervals of this table, over the attempt records of its analyses: primary sample, 10,000 attempted and 10,000 usable; sensitivity sample, 10,000 attempted and 10,000 usable. Each record is in the table of bootstrap attempts in S13. Prefixes Ab and Di name the illegal-abortion and improper-disposal contexts, pooled the legal contexts pooled, Ab_minus_Di or Ab_Di their difference; no prefix, the contexts averaged with equal weights. XS and SMA = expected evidence, XF and Financial = unexpected evidence, None = no information; A_B = A minus B. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

	Primary sample			Sensitivity sample			
Estimand	**Estimate**	**95% CI**	**n**	**Estimate**	**95% CI**	**n**	**Interval**

Note. Every saved comparison of each registered version of the RQ2 analyses, in each sample; each band is one analysis and version (registered model = the model the decision rules read; the other versions are its registered companions). Decimals follow each row's magnitude. n = the participants in the model of that version and sample. 95% intervals by each row's saved procedure (Interval): percentile bootstrap (participant resamples, stratified within the six conditions); Wald from the robust or heteroskedasticity-consistent (HC3) covariance, or from the joint normal maximum-likelihood covariance; Student t or Satterthwaite t for the linear models; — where the saved comparison has no interval (E14a's threshold differences, whose confidence sets are in its own files). No test compares the samples. Percentile-bootstrap resamples behind the bootstrap intervals of this table, over the attempt records of its analyses: primary sample, 10,000 attempted and 10,000 usable; sensitivity sample, 10,000 attempted and 10,000 usable. Each record is in the table of bootstrap attempts in S13. Prefixes Ab and Di name the illegal-abortion and improper-disposal contexts, pooled the legal contexts pooled, Ab_minus_Di or Ab_Di their difference; no prefix, the contexts averaged with equal weights. XS and SMA = expected evidence, XF and Financial = unexpected evidence, None = no information; A_B = A minus B. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

Table S13.6

Every saved comparison of the RQ3 analyses in the primary and the sensitivity samples

Note. Every saved comparison of each registered version of the RQ3 analyses, in each sample; each band is one analysis and version (registered model = the model the decision rules read; the other versions are its registered companions). Decimals follow each row's magnitude. n = the participants in the model of that version and sample. 95% intervals by each row's saved procedure (Interval): percentile bootstrap (participant resamples, stratified within the six conditions); Wald from the robust or heteroskedasticity-consistent (HC3) covariance, or from the joint normal maximum-likelihood covariance; Student t or Satterthwaite t for the linear models; — where the saved comparison has no interval (E14a's threshold differences, whose confidence sets are in its own files). No test compares the samples. Percentile-bootstrap resamples behind the bootstrap intervals of this table, over the attempt records of its analyses: primary sample, 10,000 attempted and 10,000 usable; sensitivity sample, 10,000 attempted and 10,000 usable. Each record is in the table of bootstrap attempts in S13. Prefixes Ab and Di name the illegal-abortion and improper-disposal contexts, pooled the legal contexts pooled, Ab_minus_Di or Ab_Di their difference; no prefix, the contexts averaged with equal weights. XS and SMA = expected evidence, XF and Financial = unexpected evidence, None = no information; A_B = A minus B. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

Table S13.7

Every saved comparison of the RQ4 analyses in the primary and the sensitivity samples

	Primary sample			Sensitivity sample			
Estimand	**Estimate**	**95% CI**	**n**	**Estimate**	**95% CI**	**n**	**Interval**

Note. Every saved comparison of each registered version of the RQ4 analyses, in each sample; each band is one analysis and version (registered model = the model the decision rules read; the other versions are its registered companions). Decimals follow each row's magnitude. n = the participants in the model of that version and sample. 95% intervals by each row's saved procedure (Interval): percentile bootstrap (participant resamples, stratified within the six conditions); Wald from the robust or heteroskedasticity-consistent (HC3) covariance, or from the joint normal maximum-likelihood covariance; Student t or Satterthwaite t for the linear models; — where the saved comparison has no interval (E14a's threshold differences, whose confidence sets are in its own files). No test compares the samples. Percentile-bootstrap resamples behind the bootstrap intervals of this table, over the attempt records of its analyses: primary sample, 10,000 attempted and 9,919 to 10,000 usable; sensitivity sample, 10,000 attempted and 9,662 to 10,000 usable. Each record is in the table of bootstrap attempts in S13. Prefixes Ab and Di name the illegal-abortion and improper-disposal contexts, pooled the legal contexts pooled, Ab_minus_Di or Ab_Di their difference; no prefix, the contexts averaged with equal weights. XS and SMA = expected evidence, XF and Financial = unexpected evidence, None = no information; A_B = A minus B. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

Table S13.8

Every saved comparison of the RQ5 analyses in the primary and the sensitivity samples

	Primary sample			Sensitivity sample			
Estimand	Estimate	95% CI	n	Estimate	95% CI	n	Interval

Note. Every saved comparison of each registered version of the RQ5 analyses, in each sample; each band is one analysis and version (registered model = the model the decision rules read; the other versions are its registered companions). Decimals follow each row's magnitude. n = the participants in the model of that version and sample. 95% intervals by each row's saved procedure (Interval): percentile bootstrap (participant resamples, stratified within the six conditions); Wald from the robust or heteroskedasticity-consistent (HC3) covariance, or from the joint normal maximum-likelihood covariance; Student t or Satterthwaite t for the linear models; — where the saved comparison has no interval (E14a's threshold differences, whose confidence sets are in its own files). No test compares the samples. No analysis in this table has a percentile-bootstrap interval. Prefixes Ab and Di name the illegal-abortion and improper-disposal contexts, pooled the legal contexts pooled, Ab_minus_Di or Ab_Di their difference; no prefix, the contexts averaged with equal weights. XS and SMA = expected evidence, XF and Financial = unexpected evidence, None = no information; A_B = A minus B. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

About this document

This part includes the supplementary tables and figures for Study 2. For the main findings, see Chapter 5. The supplementary materials cover data cleaning and missing data, descriptive and preliminary analyses, manipulation checks, RQ1 through RQ5, and the sensitivity sample. Within S1 through S9, I grouped each analysis with its hypotheses and comparisons. The tables and figures reproduce the final Study 2 estimates.

For example, Table S4.1 begins S4. The H4a–H4h comparisons and adjusted H4 means are in S6.

S2. Descriptive and preliminary analyses

Sample, judgment and attitude descriptions (D01)

Table S2.1

Abortion and miscarriage likelihood judgments by condition

	Stereotypical			Non-stereotypical				
Variable: M (SD)	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**	**Total**	**N**
Abortion outcome likelihood	44.76 (32.60)	60.79 (31.92)	40.12 (27.74)	35.15 (29.63)	47.26 (37.51)	25.39 (25.04)	42.24 (32.49)	320
Miscarriage outcome likelihood	39.47 (32.23)	27.88 (25.76)	45.38 (30.07)	58.54 (29.10)	31.28 (31.21)	60.57 (29.12)	43.88 (31.89)	320

Note. M (SD) by outcome by stereotypicality condition; N = participants with a response, all conditions. Every participant answered every variable in this table. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S2.2

Remaining cause-likelihood judgments by condition

	Stereotypical			Non-stereotypical				
Variable: M (SD)	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**	**Total**	**N**
Reckless cause likelihood	33.13 (26.23)	29.31 (26.61)	34.28 (27.47)	29.08 (23.33)	28.26 (29.00)	30.71 (27.53)	30.92 (26.63)	320
External cause likelihood	28.09 (28.45)	18.63 (22.78)	21.80 (22.27)	25.52 (23.15)	20.86 (27.98)	26.71 (27.09)	23.61 (25.38)	320

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	Stereotypical			Non-stereotypical				
Variable: M (SD)	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**	**Total**	**N**

Note. M (SD) by outcome by stereotypicality condition; N = participants with a response, all conditions. Every participant answered every variable in this table. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S2.3

Four-item foreseeability score and the general-foreseeability item by condition

	Stereotypical			Non-stereotypical				
Variable: M (SD)	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**	**Total**	**N**
Foreseeability	2.90 (0.88)	2.96 (0.86)	2.55 (0.99)	2.91 (0.95)	2.71 (1.04)	2.54 (0.93)	2.76 (0.95)	320
Foreseeable general	3.27 (0.99)	3.62 (0.97)	3.67 (1.04)	3.38 (1.11)	2.98 (1.22)	3.22 (1.12)	3.37 (1.09)	320

Note. M (SD) by outcome by stereotypicality condition; N = participants with a response, all conditions. Scale	n	k	alpha	alpha 95% CI

Note. Raw-score Cronbach's α; religiosity is standardized-item α with item SDs recalculated across all complete respondents and applied to every condition (Table below). n = complete respondents. Intervals are percentile 95% intervals from 10000 within-condition participant bootstrap attempts that preserve each condition's number of complete respondents. Usable bootstrap attempts: 10000 of 10000 for every row. No row was unavailable.

Table S2.15

Religiosity items: pooled means and SDs used for the standardized-item alpha

Item	Variable	M	SD	n
QID46	religiosity_attendance	2.39	1.64	320
QID47	religiosity_importance	4.47	3.23	320
QID48	religiosity_comfort	2.57	1.40	320
QID49	religiosity_person	4.13	3.09	320

Note. Item means and SDs across all complete respondents in the analytic sample; the same SDs standardize the items in every condition.

Checks (D03)

Table S2.16

Attention, outcome, stereotypicality and content-recognition checks: response status, all conditions

Check	Variable	Rule	Assessed	Correct	Incorrect	Missing	Not sure	Don't remember
QID19	attention_1	exclude only if all three observed responses are incorrect	366	365	1	0		
QID33	attention_2	exclude only if all three observed	366	365	1	0		

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Check	Variable	Rule	Assessed	Correct	Incorrect	Missing	Not sure	Don't remember
		responses are incorrect						
QID43	attention_3	exclude only if all three observed responses are incorrect	366	365	1	0		
QID38	stereotypicality_check	sensitivity only	366	343	12	0	11	
QID39	outcome_check	sensitivity only	366	215	75	0		76
QID40	content_recognition	sensitivity only	366	310	56	0		

Note. Counts of participants by response status, from the check-status counts (analytic sample, all conditions); the by-condition rows are in the saved CSV. A blank entry means the status does not apply to that check.

Fixed relevance and incrimination measurement (M01)

Note. χ^2 = Yuan–Bentler scaled χ^2 (MLR; lavaan test yuan.bentler.mplus), with its df and p; CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation (with 90% CI); SRMR = standardized root mean square residual. CFI, TLI and RMSEA (with its 90% CI) are computed from the scaled χ^2 (lavaan's .scaled indices). lavaan estimator MLR, test standard + yuan.bentler.mplus and missing = ml: robust maximum likelihood with FIML, as registered. Every value is the analysis's saved index; SRMR is unscaled. The indices describe each whole fit, which carries the registered likelihood equations and, in adjusted versions, the auxiliary attitude items as well as the measurement part. RMSEA 90% CI = the interval lavaan gives for the scaled RMSEA (fitMeasures(), robust = FALSE): the noncentral χ^2 interval of the scaled test statistic at its degrees of freedom, on the RMSEA scale with lavaan's multiple-group factor $\sqrt{G}$ (G = 6 groups). Every statistic comes from the registered fit itself (saved source: original fit); none comes from a fit-statistics-only refit. No cutoff decides anything: the registration sets none for these assessments, and nothing is compared (registry: no additional hypothesis test). N = the analysis's eligible participants; per-condition counts: H2a primary adjusted: 55;52;60;52;50;51; E1a primary adjusted: 55;52;60;52;50;51; H2a sensitivity adjusted: 32;33;45;36;29;37; E1a sensitivity adjusted: 32;33;45;36;29;37; H2a primary unadjusted: 55;52;60;52;50;51; E1a primary unadjusted: 55;52;60;52;50;51; H2a sensitivity unadjusted: 32;33;45;36;29;37; E1a sensitivity unadjusted: 32;33;45;36;29;37.

Note. Residual covariances estimated separately in each condition, as registered: the factor residual covariance and the ten covariances between the relevance and incrimination ratings of the same fact. r is the standardized residual or factor covariance (lavaan std.all), and its SE, z, p and 95% CI are for r (delta method). These covariances are not drawn in the fitted figure below. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S2.22

The ten evidence facts behind each item position, by evidence version

Evidence	Shared	Marker	Relevance	Incrimination	Fact
Position 1					
Stereotypical	this version only		rel_1	inc_1	That an anonymous coworker reported Ms. Johnston had said she used pills ordered online to handle it at home.
Non-stereotypical	this version only		rel_1	inc_1	That an anonymous coworker reported Ms. Johnston had said she handled it at home by herself.
Position 2					
Stereotypical	both versions	marker	rel_2	inc_2	That Ms. Johnston experienced cramping and heavy bleeding at home.
Non-stereotypical	both versions	marker	rel_2	inc_2	That Ms. Johnston experienced cramping and heavy bleeding at home.
Position 3					
Stereotypical	both versions		rel_3	inc_3	That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Evidence	Shared	Marker	Relevance	Incrimination	Fact
Non-stereotypical	both versions		rel_3	inc_3	That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.
Position 4					
Stereotypical	both versions		rel_4	inc_4	That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.
Non-stereotypical	both versions		rel_4	inc_4	That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.
Position 5					
Stereotypical	both versions		rel_5	inc_5	That Ms. Johnston did not call 911 or seek in-person medical care.
Non-stereotypical	both versions		rel_5	inc_5	That Ms. Johnston did not call 911 or seek in-person medical care.
Position 6					

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Evidence	Shared	Marker	Relevance	Incrimination	Fact
Stereotypical	this version only		rel_6	inc_6	That Ms. Johnston was 18 years old, unmarried, and had no children.
Non-stereotypical	this version only		rel_6	inc_6	That Ms. Johnston was 31 years old, married, and had two school-age children.
Position 7					
Stereotypical	this version only		rel_7	inc_7	That Ms. Johnston lived with a roommate, who was out of town on the day of the event.
Non-stereotypical	this version only		rel_7	inc_7	That Ms. Johnston lived with her husband and two children, who were at work and at school on the day of the event.
Position 8					
Stereotypical	this version only		rel_8	inc_8	That Ms. Johnston did not tell anyone on the day of the event.
Non-stereotypical	this version only		rel_8	inc_8	That Ms. Johnston told her husband on the day of the event.
Position 9					
Stereotypical	this version only		rel_9	inc_9	That Ms. Johnston kept a hair appointment that afternoon and

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Evidence	Shared	Marker	Relevance	Incrimination	Fact
					worked her shifts over the next two days.
Non-stereotypical	this version only		rel_9	inc_9	That Ms. Johnston completed school pickup that afternoon and worked her shifts over the next two days while managing school drop-off and pickup.
Position 10					
Stereotypical	both versions		rel_10	inc_10	That Detective Snyder had 14 years of experience with the Millfield Police Department.
Non-stereotypical	both versions		rel_10	inc_10	That Detective Snyder had 14 years of experience with the Millfield Police Department.

Note. Fact wording from the evidence-indicator map the analysis uses. One row band per item position.

Surprise premise check

Table S2.26

Surprise premise check: contradicting minus confirming outcome information, two-by-two ANCOVA

Version	Estimate	SE	df	95% CI	N	Includes zero
primary sample						
adjusted	0.33	0.18	205	[−0.02, 0.68]	213	yes
unadjusted	0.33	0.18	209	[−0.02, 0.68]	213	yes
sensitivity sample						
adjusted	0.56	0.23	136	[0.11, 1.01]	144	no
unadjusted	0.57	0.22	140	[0.12, 1.01]	144	no

Note. Contrast: Contradicting minus confirming outcome information: mean(A_NCM, M_SMA) - mean(A_SMA, M_NCM), outcome-information participants (surprise premise check; reported). Student t 95% interval with the residual df of each fit; the adjusted versions control for the four attitude measures, the unadjusted versions do not. N = the analysis's eligible participants (outcome-information conditions only). A premise check, not a registered hypothesis: nothing is decided here.

S3. Manipulation checks and the registered stereotypicality rule

The registered stereotypicality rule

Table S3.1

Stereotypicality check in the primary sample: the registered rule, by evidence condition

Evidence condition	n	Matching description	I'm not sure	Blank	Rate (%)	95% CI	At or above threshold
Stereotypical	167	156	7	0	93.4	[88.6, 96.3]	yes
Non-stereotypical	153	147	3	0	96.1	[91.7, 98.2]	yes

Note. Primary sample. *n* per evidence condition from the eligibility records of the data preparation. Rate = matching descriptions / *n* "I'm not sure" and a blank response do not match. 95% CI = Wilson score interval for the proportion, without continuity correction. Registered threshold: 60%, read from the quoted supplement sentence. Verdict: manipulated.

Identification rates for both manipulations

Table S3.2

Stereotypicality check: participants choosing the description that matches their evidence

Sample	n	Identifying	I'm not sure	Other choice	Blank	Rate (%)	95% CI
Stereotypical							
Primary	167	156	7	4	0	93.4	[88.6, 96.3]
Admitted	189	174	8	7	0	92.1	[87.3, 95.1]
Non-stereotypical							
Primary	153	147	3	3	0	96.1	[91.7, 98.2]
Admitted	177	169	3	5	0	95.5	[91.3, 97.7]
Stereotypical, None							
Primary	55	51	2	2	0	92.7	[82.7, 97.1]
Admitted	61	55	3	3	0	90.2	[80.2, 95.4]
Stereotypical, SMA							

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Sample	n	Identifying	I'm not sure	Other choice	Blank	Rate (%)	95% CI
Primary	52	48	3	1	0	92.3	[81.8, 97.0]
Admitted	62	58	3	1	0	93.5	[84.6, 97.5]
Stereotypical, NCM							
Primary	60	57	2	1	0	95.0	[86.3, 98.3]
Admitted	66	61	2	3	0	92.4	[83.5, 96.7]
Non-stereotypical, None							
Primary	52	48	1	3	0	92.3	[81.8, 97.0]
Admitted	59	53	1	5	0	89.8	[79.5, 95.3]
Non-stereotypical, SMA							
Primary	50	48	2	0	0	96.0	[86.5, 98.9]
Admitted	58	56	2	0	0	96.6	[88.3, 99.0]
Non-stereotypical, NCM							
Primary	51	51	0	0	0	100.0	[93.0, 100.0]
Admitted	60	60	0	0	0	100.0	[94.0, 100.0]
All conditions							
Primary	320	303	10	7	0	94.7	[91.7, 96.7]
Admitted	366	343	11	12	0	93.7	[90.7, 95.8]

Note. *n* per condition from the eligibility records of the data preparation. Primary = the primary analytic sample; Admitted = all admitted participants. Rate = identifying responses / *n*. 95% CI = Wilson score interval for the proportion, without continuity correction.

Table S3.3

Outcome check: participants identifying their outcome information

S4. Likelihood judgments and evidence reinterpretation (RQ1)

Likelihood judgments (H1a–H1g)

Table S4.1

Equivalence tests for H1b and H1g: two one-sided tests with the registered 90% interval

Comparison	Estimate	90% CI	Bounds	p (lower)	p (upper)	Decision
H1b: Abortion likelihood, Stereotypical evidence, SMA – None	16.05	[6.36, 25.74]	[−5.00, 5.00]	< .001	.970	not supported by all registered criteria
H1g: Miscarriage likelihood, Non-stereotypical evidence, NCM – None	4.99	[−4.12, 14.09]	[−5.00, 5.00]	.036	.499	not supported by all registered criteria

Note. Two one-sided tests (TOST) of equivalence. Bounds = equivalence bounds [lower, upper] on the estimate's scale. Registered equivalence bounds: −5 to 5 points on the 0-100 likelihood scale. p (lower) tests the null that the difference is at or below the lower bound; p (upper), that it is at or above the upper bound. 90% CI = Student t confidence interval. Estimated with marginaleffects 0.32.0. The saved TOST p value (the larger of the two) equals the larger of the two one-sided p values shown. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S4.2

Full ANCOVA source tables for the two likelihood judgments (primary sample, adjusted)

Source	F	df1	df2	p	partial_eta2	90% CI
Abortion likelihood						
evidence	14.45	1	310	< .001	.045	[.020, 1.000]
outcome	14.07	2	310	< .001	.083	[.046, 1.000]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Source	F	df1	df2	p	partial_eta2	90% CI
Abortion attitudes	0.61	1	310	.434	.002	[.000, 1.000]
Punishment support	8.77	1	310	.003	.028	[.009, 1.000]
Hostile sexism	0.06	1	310	.813	.000	[.000, 1.000]
Benevolent sexism	0.12	1	310	.727	.000	[.000, 1.000]
evidence:outcome	0.32	2	310	.728	.002	[.000, 1.000]
Miscarriage likelihood						
evidence	18.70	1	310	< .001	.057	[.029, 1.000]
outcome	21.84	2	310	< .001	.124	[.080, 1.000]
Abortion attitudes	0.87	1	310	.352	.003	[.000, 1.000]
Punishment support	9.28	1	310	.003	.029	[.010, 1.000]
Hostile sexism	3.87	1	310	.050	.012	[.001, 1.000]
Benevolent sexism	0.52	1	310	.471	.002	[.000, 1.000]
evidence:outcome	2.14	2	310	.119	.014	[.000, 1.000]

Note. Analysis of covariance (ANCOVA) with abortion attitudes, support for punishment, hostile sexism, and benevolent sexism as covariates. Type-II F-tests. Partial eta-squared (η^2_p) is shown with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. The evidence × outcome row is the registered two-df F test of the restricted against the full model. One band per likelihood judgment.

Comparison	ID	Letter	Estimate	SE	t	df	p	Interval	Omnibus test	Protected p	Tukey (check)

Note. Every comparison the analysis saves for the two ANCOVAs, in each of the four versions: the restricted-versus-full F, the within-evidence comparisons, the averaged comparisons (the stereotypicality-fallback secondary estimates), the baseline expectation and the between-evidence differences of each outcome effect. Adjusted versions control for the four attitude measures; unadjusted versions do not. Rows marked (reported), SMA – NCM within each evidence condition, are reported comparisons, not registered ones: the registration compares each outcome condition with no outcome information and treats every other comparison as exploratory, so they carry no letter, direction or decision. I added them after registration (2026-09-29), using the fitted models. Rows marked (reported) were added after registration and were tested with Fisher's protected least significant difference procedure; a comparison is significant only when the omnibus test of the three outcome conditions is significant (Levin et al., 1994). Omnibus test = the joint test that SMA – None and NCM – None within that evidence condition are both zero, F(2, residual df), from the same fit and coefficient covariance as the comparisons (not the restricted-versus-full F). Protected p = the larger of the comparison's own p and the omnibus p; a reported comparison is significant when its protected p is below .05. — = a saved row: the registration tests its comparisons without an omnibus gate. Tukey-adjusted *p* values are shown as a check on the procedure; the significance decisions follow the protected least significant difference procedure. Intervals: Student t with the residual df from the full coefficient covariance, 95% for every row except the two equivalence rows (H1b, H1g), which carry the registered 90% TOST interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Table S4.4

Baseline expectations: stereotypical minus non-stereotypical evidence in the None condition

Version	Expected	Estimate	SE	t	df	p	95% CI
Abortion likelihood, primary sample							
adjusted	above zero	9.36	5.85	1.60	310	.111	[−2.15, 20.87]
unadjusted	above zero	9.61	5.98	1.61	314	.109	[−2.15, 21.37]
Abortion likelihood, sensitivity sample							

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Version	Expected	Estimate	SE	t	df	p	95% CI
adjusted	above zero	15.69	7.44	2.11	202	.036	[1.02, 30.37]
unadjusted	above zero	14.70	7.51	1.96	206	.052	[−0.11, 29.52]
Miscarriage likelihood, primary sample							
adjusted	below zero	−18.53	5.41	−3.43	310	< .001	[−29.17, −7.88]
unadjusted	below zero	−19.07	5.74	−3.32	314	.001	[−30.36, −7.77]
Miscarriage likelihood, sensitivity sample							
adjusted	below zero	−26.21	6.74	−3.89	202	< .001	[−39.50, −12.92]
unadjusted	below zero	−25.03	7.08	−3.53	206	< .001	[−38.99, −11.07]

Note. Difference between the two no-information conditions (stereotypical minus non-stereotypical evidence), read from the separate no-information baselines of each H1 model. Student t 95% interval with the residual df from the full coefficient covariance. Expected = the direction the registration states. This check does not test a registered hypothesis, and nothing is decided here. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Evidence reinterpretation (H2a–H2d)

Table S4.5

Indirect effects of outcome information on the two likelihood judgments through evidence relevance (H2a–H2d)

Letter	Evidence	Contrast	Likelihood	Direction	Indirect effect b	95% percentile CI	Usable attempts	Decision
H2a	Non-stereotypical	SMA – None	Abortion likelihood	above zero	−1.51	[−4.98, 2.35]	9995 of 10000	not supported by all registered criteria
H2b	Non-stereotypical	SMA – None	Miscarriage likelihood	below zero	1.88	[−3.11, 6.01]	9995 of 10000	not supported by all

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Letter	Evidence	Contrast	Likelihood	Direction	Indirect effect b	95% percentile CI	Usable attempts	Decision
								registered criteria
H2c	Stereotypical	NCM – None	Abortion likelihood	below zero	0.93	[–1.97, 4.15]	9995 of 10000	not supported by all registered criteria
H2d	Stereotypical	NCM – None	Miscarriage likelihood	above zero	–1.16	[–5.22, 2.43]	9995 of 10000	not supported by all registered criteria

Note. Indirect effect = the outcome difference in latent relevance (the SMA or NCM factor intercept; the no-information intercept is fixed at 0) times the relevance-to-likelihood slope, which is common to the six conditions, on the 0–100 likelihood scale; primary sample, adjusted. Direction = the registered sign; a letter's rule reads its interval against zero in that direction. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per product: 9995 (failed attempts are not replaced). Registered analysis path: latent. Estimator ML with robust.huber.white standard errors and missing = ml. Scaled fit of the whole model: scaled $\chi^2(668) = 1294.41$, $p < .001$, CFI = 0.657, TLI = 0.630, RMSEA = 0.133 (90% CI [0.122, 0.143]), SRMR = 0.144. No model variable was missing, so no auxiliary items were used. Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Figure S4.1

Fitted chains of the registered latent relevance model (H2a–H2d)

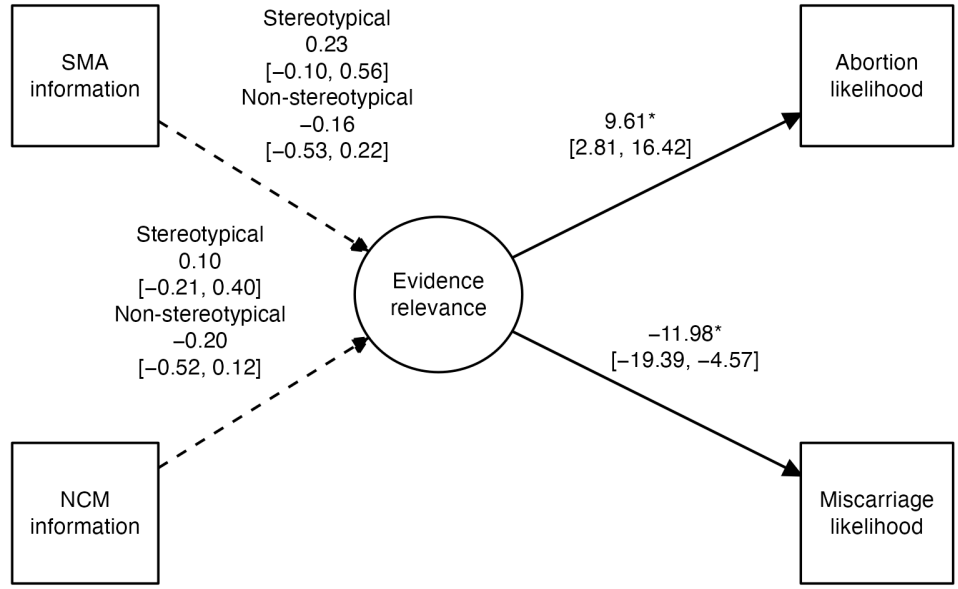

Table S4.6

Global fit of the H2a model in the four sample and adjustment versions: scaled test statistic and indices as saved by the analysis

Version	N	chi2	df	p	chi2/df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
primary sample										
adjusted	320	1294.41	668	< .001	1.94	0.657	0.630	0.133	[0.122, 0.143]	0.144
unadjusted	320	892.15	404	< .001	2.21	0.612	0.619	0.151	[0.137, 0.164]	0.154
sensitivity sample										
adjusted	212	1258.95	668	< .001	1.88	0.584	0.552	0.158	[0.144, 0.172]	0.164

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Version	N	chi2	df	p	chi2/df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
unadjusted	212	842.21	404	< .001	2.08	0.551	0.560	0.175	[0.158, 0.192]	0.178

Note. χ^2 = Yuan–Bentler scaled χ^2 (MLR; lavaan test yuan.bentler.mplus), with its df and p; CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation (with 90% CI); SRMR = standardized root mean square residual. CFI, TLI and RMSEA (with its 90% CI) are computed from the scaled χ^2 (lavaan's .scaled indices). RMSEA 90% CI = the interval lavaan gives for the scaled RMSEA (fitMeasures(), robust = FALSE): the noncentral χ^2 interval of the scaled test statistic at its degrees of freedom, on the RMSEA scale with lavaan's multiple-group factor √G (G = 6 groups). lavaan estimator ML with robust.huber.white standard errors, test standard + yuan.bentler.mplus and missing = ml: robust maximum likelihood (MLR) with FIML, as registered. Every statistic comes from the registered fit itself (saved source: original fit); none comes from a fit-statistics-only refit. No model variable was missing, so no auxiliary items were used. No cutoff decides anything: the registration sets none for this model. N = the analysis's eligible participants.

Table S4.7

Structural paths of the H2a model by condition (primary sample, adjusted): unstandardized b with β beside it

Predictor	b	SE	z	p	β	95% CI	Constraint

Note. b = unstandardized coefficient; β = standardized coefficient (lavaan std.all, within condition). SE, z, p and the 95% CI are robust (Huber-White) Wald statistics on b. Constraint = the registered equality the saved labels carry. Rows are labeled with the condition from the parameter table by outcome, predictor, and group. The 0 auxiliary regressions of the adjusted fit are omitted. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Note. b = unstandardized loading (SE); β = standardized loading (lavaan std.all, within condition). The 95% CI and z are Wald statistics on b with the fit's robust.huber.white standard errors. The marker is item position 2 (That Ms. Johnston experienced cramping and heavy bleeding at home.), fixed at 1 in every condition; the other equalities are the registered ones printed above. The same loadings as the measurement table in S2. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S4.9

All relevance products of the H2a model, by evidence condition, with the registered evidence differences (template Part D layout)

			Stereotypical		Non-stereotypical		Difference	
Pathway	Type	Letter	b	95% CI	b	95% CI	b	95% CI
SMA – None → Relevance →	single-mediator	H2a (non-stereotypical)	2.24	[−0.67, 5.82]	−1.51	[−4.98, 2.35]	3.75	[−1.09, 8.85]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

			Stereotypical		Non-stereotypical		Difference	
Pathway	**Type**	**Letter**	**b**	**95% CI**	**b**	**95% CI**	**b**	**95% CI**
Abortion likelihood								
SMA – None → Relevance → Miscarriage likelihood	single-mediator	H2b (non-stereotypical)	−2.79	[−7.40, 0.81]	1.88	[−3.11, 6.01]	−4.67	[−11.03, 1.45]
NCM – None → Relevance → Abortion likelihood	single-mediator	H2c (stereotypical)	0.93	[−1.97, 4.15]	−1.92	[−5.70, 1.29]	2.85	[−1.40, 7.93]
NCM – None → Relevance → Miscarriage likelihood	single-mediator	H2d (stereotypical)	−1.16	[−5.22, 2.43]	2.40	[−1.64, 7.04]	−3.56	[−9.93, 1.80]

Note. b = unstandardized product on the 0–100 likelihood scale (the outcome difference in relevance times the common relevance-to-likelihood slope). Letter = the registered confirmatory read (H2a–H2d) and the block it applies to; every other product and the evidence differences are reported without a support decision. Difference = stereotypical minus non-stereotypical product. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per product: 9995 (failed attempts are not replaced). The model's direct effects of outcome information are the likelihood intercept differences in the intercept table; the model estimates no total effect as a saved target, so none is shown. No SE or β is shown for a product: its registered interval is the percentile bootstrap interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Note. b = unstandardized product on the 0–100 likelihood scale: the outcome difference in each factor (its SMA or NCM intercept; the no-information intercept is fixed at 0) times that factor's likelihood slope, controlling for the other factor; slopes are common to the six conditions. Sum = relevance plus incrimination product. Difference = stereotypical minus non-stereotypical. Exploratory: reported without a support gate. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per product: 9992 (failed attempts are not replaced). Estimator ML with robust.huber.white standard errors and missing = ml. Scaled fit of the whole model: scaled $\chi^2(1838) = 3698.21$, $p < .001$, CFI = 0.625, TLI = 0.602, RMSEA = 0.138 (90% CI [0.131, 0.144]), SRMR = 0.164. No model variable was missing, so no auxiliary items were used. Residual covariances estimated separately in each condition, as registered: the factor residual covariance and the ten covariances between the relevance and incrimination ratings of the same fact, shown in the covariance table below and not drawn in the figure. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Note. Separate means for each item position in each of the six conditions, four common attitude slopes, a participant random intercept and a common residual variance; restricted maximum likelihood, as registered. Item positions name different facts in the two evidence versions where the fact is version-unique (fact key in S2 and in the difference table below). Fixed effects: b (SE) with Wald 95% CIs and Satterthwaite-df t tests from the fitted model; these describe the model and are not the registered read, which is the forty differences below with their percentile bootstrap intervals. ICC = 0.248; marginal and conditional R-squared 0.318 and 0.487 (approximated as the package states). Singular fit: no. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S4.13

E1b: SMA and NCM information compared with None for each fact, within each evidence condition

Contrast	Difference	95% percentile CI	Usable attempts
Stereotypical evidence, position 1: That an anonymous coworker reported Ms. Johnston had said she used pills ordered online to handle it at home.			
SMA – None	0.84	[−0.01, 1.67]	10000 of 10000
NCM – None	0.34	[−0.52, 1.21]	10000 of 10000
Stereotypical evidence, position 2: That Ms. Johnston experienced cramping and heavy bleeding at home.			
SMA – None	−0.14	[−0.94, 0.68]	10000 of 10000
NCM – None	0.32	[−0.47, 1.12]	10000 of 10000
Stereotypical evidence, position 3: That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.			
SMA – None	0.02	[−0.68, 0.74]	10000 of 10000
NCM – None	0.04	[−0.65, 0.76]	10000 of 10000
Stereotypical evidence, position 4: That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.			
SMA – None	0.35	[−0.36, 1.09]	10000 of 10000
NCM – None	0.10	[−0.62, 0.87]	10000 of 10000

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Contrast	Difference	95% percentile CI	Usable attempts
Stereotypical evidence, position 5: That Ms. Johnston did not call 911 or seek in-person medical care.			
SMA – None	0.76	[−0.01, 1.52]	10000 of 10000
NCM – None	0.38	[−0.41, 1.17]	10000 of 10000
Stereotypical evidence, position 6: That Ms. Johnston was 18 years old, unmarried, and had no children.			
SMA – None	0.19	[−0.79, 1.19]	10000 of 10000
NCM – None	0.13	[−0.84, 1.10]	10000 of 10000
Stereotypical evidence, position 7: That Ms. Johnston lived with a roommate, who was out of town on the day of the event.			
SMA – None	0.09	[−0.77, 0.97]	10000 of 10000
NCM – None	0.04	[−0.82, 0.87]	10000 of 10000
Stereotypical evidence, position 8: That Ms. Johnston did not tell anyone on the day of the event.			
SMA – None	0.33	[−0.63, 1.25]	10000 of 10000
NCM – None	0.32	[−0.63, 1.27]	10000 of 10000
Stereotypical evidence, position 9: That Ms. Johnston kept a hair appointment that afternoon and worked her shifts over the next two days.			
SMA – None	0.55	[−0.42, 1.52]	10000 of 10000
NCM – None	0.29	[−0.66, 1.22]	10000 of 10000
Stereotypical evidence, position 10: That Detective Snyder had 14 years of experience with the Millfield Police Department.			
SMA – None	0.74	[−0.18, 1.65]	10000 of 10000
NCM – None	0.41	[−0.55, 1.34]	10000 of 10000
Non-stereotypical evidence, position 1: That an anonymous coworker reported Ms. Johnston had said she handled it at home by herself.			
SMA – None	−0.51	[−1.48, 0.40]	10000 of 10000
NCM – None	−0.13	[−0.93, 0.68]	10000 of 10000
Non-stereotypical evidence, position 2: That Ms. Johnston experienced cramping and heavy bleeding at home.			
SMA – None	−0.39	[−1.16, 0.40]	10000 of 10000
NCM – None	−0.35	[−1.20, 0.47]	10000 of 10000

Contrast	Difference	95% percentile CI	Usable attempts
Non-stereotypical evidence, position 3: That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.			
SMA – None	−0.65	[−1.36, 0.04]	10000 of 10000
NCM – None	−0.24	[−0.90, 0.40]	10000 of 10000
Non-stereotypical evidence, position 4: That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.			
SMA – None	−0.08	[−0.84, 0.69]	10000 of 10000
NCM – None	−0.48	[−1.18, 0.22]	10000 of 10000
Non-stereotypical evidence, position 5: That Ms. Johnston did not call 911 or seek in-person medical care.			
SMA – None	0.41	[−0.46, 1.29]	10000 of 10000
NCM – None	0.10	[−0.80, 0.98]	10000 of 10000
Non-stereotypical evidence, position 6: That Ms. Johnston was 31 years old, married, and had two school-age children.			
SMA – None	−1.39	[−2.36, −0.39]	10000 of 10000
NCM – None	−0.76	[−1.79, 0.25]	10000 of 10000
Non-stereotypical evidence, position 7: That Ms. Johnston lived with her husband and two children, who were at work and at school on the day of the event.			
SMA – None	−0.82	[−1.77, 0.16]	10000 of 10000
NCM – None	−0.85	[−1.78, 0.12]	10000 of 10000
Non-stereotypical evidence, position 8: That Ms. Johnston told her husband on the day of the event.			
SMA – None	−0.53	[−1.54, 0.47]	10000 of 10000
NCM – None	−0.16	[−1.15, 0.83]	10000 of 10000
Non-stereotypical evidence, position 9: That Ms. Johnston completed school pickup that afternoon and worked her shifts over the next two days while managing school drop-off and pickup.			
SMA – None	−0.46	[−1.51, 0.59]	10000 of 10000
NCM – None	−0.61	[−1.64, 0.43]	10000 of 10000
Non-stereotypical evidence, position 10: That Detective Snyder had 14 years of experience with the Millfield Police Department.			
SMA – None	0.74	[−0.24, 1.71]	10000 of 10000
NCM – None	0.11	[−0.84, 1.03]	10000 of 10000

S5. Moral judgments of the plaintiff (RQ2)

Differences across judgments (H3a–H3b)

Table S5.1

Adjusted means of the eight plaintiff judgments by condition, from the H3a and H3b fits (primary sample, adjusted)

	Stereotypical			Non-stereotypical		
Judgment: M [95% CI]	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Moral judgments (H3a)						
Deserved punishment	3.07 [2.66, 3.48]	2.99 [2.56, 3.42]	2.60 [2.21, 2.99]	2.74 [2.31, 3.16]	2.45 [2.02, 2.88]	2.25 [1.82, 2.68]
Plaintiff blame	3.83 [3.37, 4.29]	4.58 [4.10, 5.05]	3.34 [2.90, 3.78]	3.55 [3.08, 4.02]	4.27 [3.79, 4.75]	3.04 [2.56, 3.52]
Wrongness	3.66 [3.21, 4.12]	3.90 [3.43, 4.37]	3.36 [2.92, 3.80]	3.33 [2.86, 3.80]	3.77 [3.30, 4.25]	3.20 [2.73, 3.68]
Sympathy (reverse-scored)	3.20 [2.77, 3.62]	3.67 [3.23, 4.10]	2.89 [2.48, 3.30]	3.10 [2.66, 3.53]	3.39 [2.94, 3.83]	2.68 [2.24, 3.13]
Mental states (H3b)						
Purpose	3.82 [3.41, 4.23]	5.16 [4.74, 5.59]	3.35 [2.95, 3.75]	3.23 [2.81, 3.65]	4.57 [4.15, 4.99]	2.76 [2.34, 3.18]
Knowledge	3.77 [3.39, 4.15]	4.92 [4.53, 5.31]	3.31 [2.94, 3.68]	3.29 [2.90, 3.67]	4.44 [4.05, 4.83]	2.83 [2.44, 3.21]
Recklessness	4.26 [3.89, 4.63]	5.48 [5.10, 5.86]	3.91 [3.56, 4.27]	3.81 [3.43, 4.18]	5.03 [4.65, 5.40]	3.46 [3.09, 3.84]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	Stereotypical			Non-stereotypical		
Judgment: M [95% CI]	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Negligence	4.61 [4.24, 4.99]	5.73 [5.34, 6.11]	4.05 [3.69, 4.42]	4.01 [3.63, 4.39]	5.12 [4.74, 5.51]	3.45 [3.06, 3.83]

Note. Adjusted means on the 1–7 scale with Student t 95% intervals from each fit's coefficient covariance and residual df; attitudes at their means in each model. The H3a model has a mean for each of the six conditions; the H3b model is additive in outcome and evidence (no interaction), so its six means are model-implied from the effects-coded terms. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S5.2

Every saved H3a and H3b comparison in the four sample and adjustment versions

	Primary, adjusted		Primary, unadjusted		Sensitivity, adjusted		Sensitivity, unadjusted	
Comparison	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**
Moral judgments (H3a)								
Registered contrast (H3a): punishment relative to the other moral judgments	−0.55 [−0.85, −0.24]	< .001	−0.52 [−0.82, −0.22]	< .001	−0.69 [−1.05, −0.32]	< .001	−0.68 [−1.04, −0.32]	< .001

Note. Every comparison the H3a and H3b analyses save, in each version: the registered contrast, the H3b profile comparisons (reported without a directional prediction) and each judgment's outcome comparison, evidence conditions weighted equally. Adjusted versions control for the four attitude measures; unadjusted versions do not. Student t 95% intervals from the full coefficient covariance with the residual df of each multivariate fit; p two-sided. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Table S5.3

Moral-judgment synthesis: the H3a contrast and its constituent SMA – NCM estimates (primary sample, adjusted)

Estimate	SMA – NCM	SE	t	df	p	95% CI
Deserved punishment	0.30	0.21	1.38	310	.168	[−0.13, 0.72]
Plaintiff blame	1.23	0.24	5.18	310	< .001	[0.76, 1.70]
Wrongness	0.55	0.24	2.34	310	.020	[0.09, 1.02]
Sympathy (reverse-scored)	0.74	0.22	3.35	310	< .001	[0.31, 1.17]
Mean of blame, wrongness and reverse-scored sympathy	0.84	0.19	4.34	310	< .001	[0.46, 1.22]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Estimate	SMA − NCM	SE	t	df	p	95% CI
Punishment minus that mean (the H3a contrast)	−0.55	0.15	−3.56	310	< .001	[−0.85, −0.24]

Note. Read from the saved H3a fit with its model, participants (N = 320), 1–7 scale and Student t 95% intervals from the full coefficient covariance: each judgment's SMA − NCM difference (evidence conditions weighted equally), the mean of the three comparison judgments computed from the same fit with the same weights, and the registered contrast. Descriptive: no support decision. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Likelihood, mental states and plaintiff moral judgments (H3c; E2a–E2d)

Table S5.4

All SMA − NCM products of the joint plaintiff model by judgment, with the registered constituent paths and the between-judgment differences (template Part D layout)

Pathway	Type	Letter	b	95% percentile CI	Usable attempts
Plaintiff blame (1–7)					
SMA − NCM → likelihood → negligence → plaintiff blame	two-mediator serial	H3c	0.144	[0.039, 0.310]	10000 of 10000
SMA − NCM → likelihood → recklessness → plaintiff blame	two-mediator serial	E2a	0.111	[−0.044, 0.276]	10000 of 10000
SMA − NCM → negligence → plaintiff blame	single-mediator		0.256	[0.065, 0.517]	10000 of 10000
SMA − NCM → recklessness → plaintiff blame	single-mediator		0.134	[−0.050, 0.331]	10000 of 10000

Pathway	Type	Letter	b	95% percentile CI	Usable attempts

Note. b = unstandardized SMA − NCM quantity on the rating scale of the judgment (1–7), computed at the pooled SMA/NCM reference; the constituent paths are unstandardized slopes common to the six conditions. Letter = the registered read: H3c (confirmatory, also in the manuscript table) and E2a–E2d (exploratory, reported in the supplement); every other row is reported without a support decision, and the punishment and wrongness rows carry no directional prediction. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 10000 (failed attempts are not replaced). No SE or β is shown for a product: its registered interval is the percentile bootstrap interval, from the same resamples for every row. Serial = through likelihood and then the mental state; shorter = through the mental state alone. Primary sample, adjusted. Auxiliary items enter the adjusted model only when a model variable is missing; none is missing in the study sample, so the production model is fitted without them (decided on 2026-09-26). No model variable was missing, so no auxiliary items were used. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S5.5

Global fit of the joint plaintiff model in the four sample and adjustment versions: scaled test statistic and indices as saved by the analysis

Version	N	chi2	df	p	chi2/df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
Primary, adjusted	320	73.64	55	.047	1.34	0.988	0.939	0.080	[0.009, 0.124]	0.054
Primary, unadjusted	320	67.15	55	.126	1.22	0.986	0.977	0.064	[0.000, 0.112]	0.148
Sensitivity, adjusted	212	128.71	55	< .001	2.34	0.938	0.696	0.195	[0.149, 0.241]	0.093
Sensitivity, unadjusted	212	105.08	55	< .001	1.91	0.928	0.882	0.161	[0.112, 0.208]	0.218

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Version	N	chi2	df	p	chi2/df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR

Note. χ^2 = Yuan–Bentler scaled χ^2 (MLR; lavaan test yuan.bentler.mplus), with its df and p; CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation (with 90% CI); SRMR = standardized root mean square residual. CFI, TLI and RMSEA (with its 90% CI) are computed from the scaled χ^2 (lavaan's .scaled indices). RMSEA 90% CI = the interval lavaan gives for the scaled RMSEA (fitMeasures(), robust = FALSE): the noncentral χ^2 interval of the scaled test statistic at its degrees of freedom, on the RMSEA scale with lavaan's multiple-group factor √G (G = 6 groups). lavaan estimator ML with robust.huber.white standard errors, test none and missing = ml: robust maximum likelihood (MLR) with FIML, as registered. The statistics for plaintiff-pathways primary adjusted; plaintiff-pathways primary unadjusted; plaintiff-pathways sensitivity adjusted; plaintiff-pathways sensitivity unadjusted come from a fit-statistics-only refit of the registered model with its estimator's default test, evaluated at the registered estimates (largest difference from them: 0). Auxiliary items enter the adjusted model only when a model variable is missing; none is missing in the study sample, so the production model is fitted without them (decided on 2026-09-26). No model variable was missing, so no auxiliary items were used. No cutoff decides anything: the registration sets none for this model. N = the analysis's eligible participants.

Note. b = unstandardized coefficient; β = standardized coefficient (lavaan std.all, within condition). SE, z, p and the 95% CI are robust (Huber-White) Wald statistics on b. Constraint = the registered equality the saved labels carry: the substantive slopes are equal across the six conditions and the attitude slopes are free. Rows are labeled with the condition from the parameter table by outcome, predictor, and group, one band per condition. The 0 auxiliary regressions of the adjusted fit are omitted. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

evidence:outcome	0.08	2	310	.924	.001	[.000, 1.000]

Note. Analysis of covariance (ANCOVA) with abortion attitudes, support for punishment, hostile sexism, and benevolent sexism as covariates. Type-II F-tests. Partial eta-squared (η^2_p) is shown with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. The evidence × outcome row matches the Wald F of the interaction computed from the coefficients and their covariance. The registered read is the SMA – NCM comparison, made regardless of these tests.

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Scope	Letter	Estimate	SE	t	df	p	95% CI	Pooled estimate interpreted	Decision

Note. Differences in adjusted means between two mental-state ratings (1–7 scale) from the H3b effects-coded multivariate ANCOVA, at the pooled attitude means and weighting evidence conditions equally within each outcome condition; the pooled row weights all six conditions equally. E2g's registered read is the SMA – NCM difference of the knowledge – recklessness difference. Student t 95% intervals from the same coefficient covariance with the residual df; primary sample, adjusted. Letter = the registered decision row (E2e, E2f pooled; E2g SMA minus NCM); the condition-specific rows are reported and do not determine support. As registered, an ordering that changes sign across the outcome conditions is reported and its pooled estimate is not interpreted; the interpretation column carries that flag, and the decision of a flagged letter reflects it. Exploratory: the supplement reports these letters. Decision: each letter's registered rule applied to its saved interval. Decision: not interpreted (the ordering changes sign across the outcome conditions); the registered rule applied to the pooled interval gives E2e not supported by all registered criteria. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Note. Adjusted-mean differences from the full ANCOVA of each evaluation (evidence, outcome information and their interaction, four attitude covariates with common slopes, pooled residual variance), primary sample, adjusted. Each comparison weights the two evidence conditions equally. Student t tests and 95% t intervals from the full OLS coefficient covariance with the residual df; no adjustment for multiple comparisons (registered). Predicted direction = the registered sign; each letter's rule reads its own interval against zero in that direction, with no joint-support rule. Overall test of outcome information in each ANCOVA (Type II F, reported regardless of the comparisons, as registered): decision quality, $F(2, 310) = 1.48$, $p = .228$; officer blame, $F(2, 310) = 0.20$, $p = .818$; deserved consequences, $F(2, 310) = 2.78$, $p = .064$; arrest wrongness, $F(2, 310) = 1.21$, $p = .300$. Decision: each letter's registered rule applied to its saved interval. $N = 320$ (Stereotypical, None, $n = 55$; Stereotypical, SMA, $n = 52$; Stereotypical, NCM, $n = 60$; Non-stereotypical, None, $n = 52$; Non-stereotypical, SMA, $n = 50$; Non-stereotypical, NCM, $n = 51$).

Source	F	df1	df2	p	Partial η²	90% CI

Note. Analysis of covariance (ANCOVA) with abortion attitudes, support for punishment, hostile sexism, and benevolent sexism as covariates. Type-II F-tests. Partial η² = partial eta-squared (η^2_p) with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. The adjusted bands are the full ANCOVAs with the four attitude covariates. The unadjusted bands are the two-way ANOVAs without covariates. The registered reads are the comparisons in the tables above, not these F tests.

Table S6.4

Every saved H4 comparison in the four sample and adjustment versions

Note. Every comparison the analysis saves for the four ANCOVAs: SMA and NCM against no outcome information, the two evidence conditions weighted equally, in each sample (primary; sensitivity) and adjustment version (adjusted for the four attitudes; unadjusted). Student t 95% intervals from the full coefficient covariance with each model's residual df. The registered read is the primary adjusted column. The rows marked (reported), SMA – NCM with the two evidence conditions weighted equally, are reported comparisons, not registered ones: the registration compares each outcome condition with no outcome information and treats every other comparison as exploratory, so they carry no letter, direction or decision. I added them after registration (2026-09-29), using the fitted models. Rows marked (reported) were added after registration and were tested with Fisher's protected least significant difference procedure; a comparison is significant only when the omnibus test of the three outcome conditions is significant (Levin et al., 1994). Omnibus test = the joint test that SMA – None and NCM – None, the two evidence conditions weighted equally, are both zero, F(2, residual df), from the same fit and coefficient covariance as the comparisons (not the Type II F of the source tables). Protected p = the larger of the comparison's own p and the omnibus p; a reported comparison is significant when its protected p is below .05. — = a registered row: the registration tests its comparisons without an omnibus gate. Tukey-adjusted *p* values are shown as a check on the procedure; the significance decisions follow the protected least significant difference procedure. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Quantity	Type	Letter	Predicted direction	Adjusted b	Adjusted 95% CI	Unadjusted b	Unadjusted 95% CI	Usable attempts	Decision

Note. b = unstandardized estimate, primary sample; Adjusted = with the four attitudes (and error preference in the consequence equation); Unadjusted = without them. Coefficients: the labeled parameters of the registered three-equation model, with robust (Huber-White) Wald 95% intervals; the foreseeability-to-blame coefficient is equal across the two evidence conditions within each outcome, and the blame-to-consequence coefficient is common to the six conditions, as registered. Products: the foreseeability-to-blame coefficient under each outcome times the common blame-to-consequence coefficient. Remaining direct difference: the analysis's average, over the included SMA and NCM participants in their own evidence condition, of the consequence equation's condition-specific terms under SMA minus under NCM (the common blame and error-preference terms cancel). Both take percentile bootstrap 95% intervals. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 10000 (failed attempts are not replaced). lavaan estimator MLR (estimator ML with robust.huber.white standard errors, missing = ml). Scaled fit of the adjusted model: scaled $\chi^2(25) = 24.31$, $p = .501$, CFI = 1.000, TLI = 1.007, RMSEA = 0.000 (90% CI [0.000, 0.106]), SRMR = 0.038. No model variable was missing, so no auxiliary items were used. Letter = the registered read; the no-information coefficient and the three products carry no registered direction and are reported without a support gate. Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Predictor	b	SE	z	p	β	95% CI	Constraint

Note. b = unstandardized coefficient; β = standardized coefficient (lavaan std.all, within condition). SE, z, p and the 95% CI are robust (Huber-White) Wald statistics on b. Constraint = the registered equality the saved labels carry. Rows are matched to the parameter table by outcome, predictor, and condition. The 0 auxiliary regressions of the adjusted fit are omitted. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

S7. Legal decisions (RQ4)

Probable-cause rulings (H5a, H5b, E4a, E4b)

Table S7.1

Additional probable-cause comparisons: NCM – None and SMA – NCM from the basic model (E4a) and the stereotypical – non-stereotypical difference of the remaining SMA – NCM difference (E4b)

Comparison	Letter	Predicted direction	Δp	95% percentile CI	Usable attempts	Decision
Basic model (all six conditions; H5a, E4a)						
NCM – None	E4a	none registered	−.02	[−.13, .10]	10000 of 10000	estimates reported; no registered decision rule
SMA – NCM	E4a	none registered	.13	[.01, .25]	10000 of 10000	estimates reported; no registered decision rule
Model with likelihood and foreseeability (SMA and NCM profiles; H5b, E4b)						
(SMA – NCM, stereotypical) – (SMA – NCM, non-stereotypical)	E4b	above zero	.02	[−.20, .24]	10000 of 10000	not supported by all registered criteria

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Comparison	Letter	Predicted direction	Δp	95% percentile CI	Usable attempts	Decision

Note. Δp = difference in the average predicted probability of a yes ruling, primary sample, adjusted. E4a reuses the H5a model and its eligible participants from all six conditions in their own evidence condition, with no directional prediction. E4b reuses the H5b model: each included SMA and NCM participant is predicted under both outcomes and both evidence conditions with their other predictors unchanged, and the non-stereotypical SMA – NCM difference is subtracted from the stereotypical one before averaging. 95% CI = participant percentile bootstrap interval from the same attempts as H5a and H5b. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 10000 of 10000 (failed attempts are not replaced). Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

	Adjusted				Unadjusted			
Term	**b**	**95% CI**	**z**	**p**	**b**	**95% CI**	**z**	**p**

Note. b = unstandardized coefficient of each component (glmmTMB; no common intercept, so each condition has its own), with the Wald 95% interval from that component's covariance and its z test; — = not in that version. The Gamma component has one dispersion parameter. These coefficients are descriptive; the registered read is the expected-award difference with its percentile bootstrap interval. Gamma dispersion: adjusted 1.112, unadjusted 1.203. Both components converged in every version. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

	Stereotypical			Non-stereotypical		
Rating and version	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
M [95% CI]						

Note. Each entry is the adjusted mean [95% t interval] from emmeans on the saved ANCOVA (adjusted: at the attitude means; unadjusted: the condition means), with the model's residual df. Each registered comparison is the difference of the equal-evidence averages of these means. *N* = 319 (Stereotypical, None, *n* = 54; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51); complete cases on the analyzed variables.

Table S7.8

Omnibus source tables of the H5d ANCOVA, adjusted and unadjusted (primary sample)

Source	F	df1	df2	p	Partial η²	90% CI
Subjective probability of guilt (0–100), adjusted						
Evidence	6.49	1	309	.011	.021	[.005, 1.000]
Outcome information	1.44	2	309	.238	.009	[.000, 1.000]
Abortion attitudes	9.86	1	309	.002	.031	[.011, 1.000]
Punishment support	28.08	1	309	< .001	.083	[.049, 1.000]
Hostile sexism	0.00	1	309	.970	.000	[.000, 1.000]
Benevolent sexism	0.34	1	309	.560	.001	[.000, 1.000]
Evidence × outcome information	0.89	2	309	.411	.006	[.000, 1.000]
Subjective probability of guilt (0–100), unadjusted						
Evidence	4.58	1	313	.033	.014	[.002, 1.000]
Outcome information	0.99	2	313	.373	.006	[.000, 1.000]
Evidence × outcome information	0.51	2	313	.601	.003	[.000, 1.000]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Source	F	df1	df2	p	Partial η²	90% CI

Note. Analysis of covariance (ANCOVA) with abortion attitudes, support for punishment, hostile sexism, and benevolent sexism as covariates. Type-II F-tests. Partial η² = partial eta-squared (η^2_p) with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. The adjusted band is the full ANCOVA with the four attitude covariates. The unadjusted band is the two-way ANOVA without covariates. The registered read is the comparison in the table above, not these F tests.

Table S7.9

Every saved H5d comparison in the four sample and adjustment versions

		Primary, adjusted		Primary, unadjusted		Sensitivity, adjusted		Sensitivity, unadjusted	
Contrast	Letter	Estimate [95% CI]	p	Estimate [95% CI]	p	Estimate [95% CI]	p	Estimate [95% CI]	p
SMA – None	H5d	3.96 [−3.31, 11.23]	.285	4.71 [−3.48, 12.89]	.259	6.94 [−2.30, 16.17]	.140	9.10 [−1.49, 19.69]	.092
NCM – None		−2.19 [−9.29, 4.91]	.544	−0.50 [−8.53, 7.53]	.902	−5.13 [−13.76, 3.50]	.243	−2.62 [−12.53, 7.29]	.602
SMA – NCM		6.15 [−1.05, 13.35]	.094	5.21 [−2.90, 13.31]	.207	12.07 [3.25, 20.88]	.008	11.72 [1.60, 21.84]	.023

Note. Every comparison the analysis saves for the H5d ANCOVA, the two evidence conditions weighted equally, in each sample (primary; sensitivity) and adjustment version (adjusted for the four attitudes; unadjusted). Student t 95% intervals from the full coefficient covariance with each model's residual df. The registered read is the primary adjusted column. *N* = 319 (Stereotypical, None, *n* = 54; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51); complete cases on the analyzed variables. In the sensitivity analysis, *N* = 211 (Stereotypical, None, *n* = 31; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37); complete cases on the analyzed variables.

		Stereotypical		Non-stereotypical		Across evidence conditions	
Pathway	**Letter**	**b**	**95% CI**	**b**	**95% CI**	**b**	**95% CI**

Note. b = unstandardized estimate on the probit scale of the ruling's latent response (WLSMV, theta parameterization: that response's intercept is fixed at zero and its residual variance at one, with a separate threshold in each condition), primary sample, adjusted. Serial product = the SMA or NCM − None difference in the relevance or incrimination factor intercept, times that factor's likelihood slope, times the likelihood-to-ruling slope; the two factor-to-likelihood slopes and the likelihood-to-ruling slope are common to the six conditions, and the foreseeability-to-ruling slope differs by outcome and is equal across evidence conditions, as registered. Foreseeability contribution = the outcome − None difference in model-implied foreseeability at the pooled attitude means, times that outcome's foreseeability-to-ruling slope; the consistency contrast (E4h) is the mean of the two outcome-consistent contributions (stereotypical SMA, non-stereotypical NCM) minus the mean of the two inconsistent ones. 95% CI = participant percentile bootstrap interval for every row, the foreseeability coefficients included (decided on 2026-09-24). Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 882 of 10000 (failed attempts are not replaced). Only 882 of 10,000 resamples produced a usable fit (the others did not converge or failed the admissibility checks); the interval summarizes those resamples alone, so it is wide and I do not interpret it. Letter = the registered read; the other rows are reported without a support gate. Scaled fit of the adjusted model: scaled $\chi^2(2088) = 2405.87$, $p < .001$, CFI = 0.585, TLI = 0.699, RMSEA = 0.054 (90% CI [0.043, 0.064]), SRMR = 0.176. No auxiliary items: the registered categorical model uses complete responses (registered analysis supplement). Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Table S7.11

Global fit of the E4d–E4h model in the four sample and adjustment versions: scaled test statistic and indices as saved by the analysis

Version	N	chi2	df	p	chi2/df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
Primary sample										
Adjusted	320	2405.87	2088	< .001	1.15	0.585	0.699	0.054	[0.043, 0.064]	0.176

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Version	N	chi2	df	p	chi2/df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
Unadjusted		Not estimable								
Sensitivity sample										
Adjusted		Not estimable								
Unadjusted		Not estimable								

Note. χ^2 = mean- and variance-adjusted (scaled-and-shifted) χ^2 (WLSMV; lavaan test scaled.shifted), with its df and p; CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation (with 90% CI); SRMR = standardized root mean square residual. CFI, TLI and RMSEA (with its 90% CI) are computed from the scaled χ^2 (lavaan's .scaled indices). RMSEA 90% CI = the interval lavaan gives for the scaled RMSEA (fitMeasures(), robust = FALSE): the noncentral χ^2 interval of the scaled test statistic at its degrees of freedom, on the RMSEA scale with lavaan's multiple-group factor √G (G = 6 groups). lavaan estimator WLSMV (DWLS with robust.sem standard errors, theta parameterization); complete responses, as registered (registered analysis supplement). The statistics for legal-indirect primary adjusted come from a fit-statistics-only refit of the registered model with its estimator's default test, evaluated at the registered estimates (largest difference from them: 5.7e-14). No cutoff decides anything: the registration sets none for this model. N = the analysis's eligible participants. Not estimable (legal-indirect, primary sample, unadjusted; legal-indirect, sensitivity sample, adjusted; legal-indirect, sensitivity sample, unadjusted): in this sample and version the model did not reach a converged, admissible solution (lavaan's convergence and post-estimation checks), so no estimates are reported. The registration requires an admissible, converged solution for an original-sample result (registered analysis supplement).

Note. b = unstandardized coefficient (the ruling equation on the probit scale of its latent response, theta parameterization); β = standardized coefficient (lavaan std.all, within condition). SE, z, p and the 95% CI are robust (WLSMV) Wald statistics on b. Constraint = the registered equality the saved labels carry. Rows are matched to the parameter table by outcome, predictor, and condition: 150 regressions. The twenty loadings and the residual covariances are in the saved parameter table and are not shown. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Pathway	Letter	b	95% CI	Median	95% CrI	b	95% CI	Median	95% CrI

Note. This follow-up with average scores is not preregistered and decides nothing; no decision rule is applied to it. Relevance and incrimination = the mean of each participant's ten ratings (the registered H2a fallback's scoring); likelihood = abortion likelihood (0–100); foreseeability = the registered four-item mean; ruling = the probable-cause ruling. One model for all six conditions (a condition factor, no common intercept): least-squares regressions of relevance, incrimination and foreseeability on the conditions and of likelihood on the conditions, relevance and incrimination, and a probit regression of the ruling on the conditions, likelihood and one foreseeability slope for each outcome condition. Adjusted: the four attitudes in every equation and error preference in the ruling; unadjusted: neither. Same eligible participants (complete responses) as the registered model; each quantity is computed from these coefficients as the registered model computes it from its own (probit scale). Letter marks the registered question a row answers in the registered model. b and 95% CI = the estimate and its participant percentile bootstrap interval over 10,000 participant resamples, the resample sets of the registered model (failed attempts are not replaced). Usable resamples per quantity: adjusted 10,000 of 10,000 (none failed); unadjusted 10,000 of 10,000 (none failed). Median and 95% CrI = the posterior median and the 95% equal-tailed credible interval of each quantity from the same model fitted with brms (Stan through cmdstanr) as one multivariate model (four Gaussian equations and the probit ruling, no residual correlations): 4 chains of 2,000 iterations (1,000 warm-up), seed 4747, continuous variables centered at their means. Priors, one rule for every version: normal(0, 2.5 × the outcome's SD) on each coefficient of the four Gaussian equations and student_t(3, 0, 2.5 × that SD) on their residual SDs; normal(0, 1) on each probit coefficient. Diagnostics (criteria: every R-hat ≤ 1.01, bulk and tail ESS ≥ 400, no divergent transitions): adjusted largest R-hat 1.014, smallest bulk and tail ESS 1,235 and 470, 0 divergent (criteria not met: not interpreted); unadjusted largest R-hat 1.003, smallest bulk and tail ESS 3,364 and 2,635, 0 divergent (criteria met). A version that fails them is shown and not interpreted. Doubling every prior scale changed the primary adjusted medians by at most 0.011 and any median or interval bound by at most 0.047 (probit scale). *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51); complete responses of the follow-up model, adjusted. *N* =

Sensitivity to restrictions across stereotypicality conditions

Table S7.14

Structural sensitivity: nested comparison of the three E4d–E4h models across stereotypicality conditions (scaled difference tests)

Model	Constraint	χ^2 (df)	$\Delta\chi^2$ (Δdf)	p
Primary, adjusted				
Model 1	SMA – NCM differences in relevance, incrimination and foreseeability, and five slopes, equal across evidence conditions	1596.82 (1362)	—	—
Model 2	the three SMA – NCM differences free across evidence conditions	1596.33 (1359)	1.72 (3)	.633
Model 3	the five slopes also free across evidence conditions	1592.73 (1354)	5.58 (5)	.349
Primary, unadjusted				
Not estimable (primary, unadjusted)				
Sensitivity, adjusted				
Not estimable (sensitivity, adjusted)				
Sensitivity, unadjusted				
Not estimable (sensitivity, unadjusted)				

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Model	Constraint	χ² (df)	Δχ² (Δdf)	p

Note. χ² (df) = WLSMV scaled-shifted chi-square and its degrees of freedom for each model. Δχ² (Δdf) and p = Satorra (2000) scaled difference test against the preceding model (lavTestLRT, A.method = "delta"). Constraint = the equality constraint(s) the model adds. — = no comparison for that row (reference model). Estimated with lavaan 0.7.2. The three models use the same SMA and NCM participants in the four conditions stereotypical and non-stereotypical × SMA and NCM, the E4d–E4h measurement rules, covariates and probit scaling (WLSMV, theta parameterization). Model 2 is compared with Model 1 (three restrictions), then Model 3 with Model 2 (five restrictions). No model is selected, and a nonsignificant difference is not read as equal pathways (registered); no fit-change criterion is registered, so none is printed. All three models converged in every version. Not estimable (structural-sensitivity, primary sample, unadjusted; structural-sensitivity, sensitivity sample, adjusted; structural-sensitivity, sensitivity sample, unadjusted): the equal-paths model (Model 1) of the registered nested comparison did not reach a converged, admissible solution, so the comparison cannot be computed in this sample and version.

Blame and compensatory awards (E4i–E4j)

Table S7.15

Blame and compensatory awards: the remaining SMA − NCM difference, its evidence difference and the ±½ SD blame probes from the two-part model (E4i, E4j)

Comparison	Letter	Predicted direction	Δ Pr(award)	Δ positive mean ($)	Δ expected award ($)	95% percentile CI	Usable attempts	Decision

Comparison	Letter	Predicted direction	Δ Pr(award)	Δ positive mean ($)	Δ expected award ($)	95% percentile CI	Usable attempts	Decision

Note. Two-part model of compensatory damages (glmmTMB: logistic regression for any award, Gamma regression with a log link for positive amounts), each with six condition intercepts, common officer- and plaintiff-blame slopes and, in the adjusted versions, four common attitude slopes. Predictions for every included SMA and NCM participant, probability times amount, zero awards included. Blame probes: each blame measure at its reference mean plus and minus half its SD, the other predictors unchanged, SMA and NCM weighted equally, actual evidence retained. SMA – NCM after accounting for blame and its evidence difference are reported without directions. Probes (primary adjusted): plaintiff blame: mean 3.84 (SD 2.14), probed at 2.77 and 4.91; observed range common to the four SMA and NCM conditions 1 to 7; both probes inside it; officer blame: mean 5.36 (SD 3.56), probed at 3.58 and 7.14; observed range common to the four SMA and NCM conditions 0 to 10; both probes inside it. 95% CI = participant percentile bootstrap interval of the expected-award difference; the two component differences are descriptive decompositions without intervals. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 9999 of 10000; 9998 of 10000; 9983 of 10000; 9775 of 10000; 9981 of 10000 (failed attempts are not replaced). Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

	Common slope (primary)			Six slopes (sensitivity)		
Quantity	Estimate	95% CI	Status	Estimate	95% CI	Status

Note. Crossing = value of the subjective probability of guilt (0–100) at which the predicted probability equals .50; differences are between crossings as labeled. 95% CI = percentile bootstrap confidence interval (10,000 bootstrap resamples requested). — inside an interval = that bound was not identified. Unavailable rows carry no estimate; Status gives the reason. Estimated with lavaan 0.7.2. In the common-slope model (primary sample, adjusted) the average predicted probability of a yes ruling never reaches .50 after NCM information, so the NCM crossing and the difference are not available. In the common-slope model (sensitivity sample, adjusted) the average predicted probability of a yes ruling never reaches .50 after no outcome information and never reaches .50 after NCM information, so both crossings and the difference are not available. A threshold is unavailable when no crossing occurs, a curve crosses downward or more than once, or numerical calculations cannot resolve a crossing (registered analysis supplement); E4k has no registered decision rule, so an unavailable threshold changes no decision. Crossing = the rating on the 0–100 subjective-probability-of-guilt scale at which the average predicted probability of a yes ruling, over every included participant in their own evidence condition, reaches .50 under that outcome information (a single upward crossing; flat, decreasing, absent, multiple or unresolved crossings are unavailable). Common slope: one probability-of-guilt slope for the six conditions; six slopes: a slope per condition (sensitivity). Both use the same participants and bootstrap draws; WLSMV probit, theta parameterization, four common attitude slopes in the adjusted versions. 95% CI = participant percentile bootstrap interval; the registration requires every required crossing in all 10,000 attempts. — = no interval: Threshold requires every attempt to be valid; Original target unavailable (usable attempts 3118 of 10000; 2345 of 10000; 961 of 10000; 6648 of 10000; 9261 of 10000; 6185 of 10000). The registration names no simultaneous band for Study 02, so none is printed. Decision: each letter's registered rule applied to its saved interval. *N* = 319 (Stereotypical, None, *n* = 54; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51); complete cases on the analyzed variables. In the sensitivity analysis, *N* = 211 (Stereotypical, None, *n* = 31; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37); complete cases on the analyzed variables.

	Stereotypical evidence	Non-stereotypical evidence	Non-stereotypical – stereotypical (E5c)		
Sample and version	b [95% CI]	b [95% CI]	b [95% CI]	z	p

Note. Within each evidence condition: the SMA coefficient minus the NCM coefficient of benevolent sexism in the plaintiff-blame equation of the sexism model (the H6a–H6b fit). E5c: the non-stereotypical difference minus the stereotypical difference; a positive value means stronger moderation under non-stereotypical evidence, the registered direction. All three with robust normal (Wald) 95% intervals from the full robust (MLR) covariance; the two parts are reported beside the registered difference and carry no rule. Decision for E5c (primary adjusted): not supported by all registered criteria. Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Abortion attitudes and officer decision quality (E5a)

Table S8.4

Abortion attitudes and the SMA – NCM difference in decision quality: the registered slope difference with its robust normal (Wald) 95% interval and the conditional differences one SD below and above the mean, in the four sample and adjustment versions (E5a)

	SMA – NCM slope difference				One SD below the mean		One SD above the mean	
Sample and version	b [95% CI]	SE	z	p	Score	SMA – NCM	Score	SMA – NCM
Primary, adjusted	0.02 [−0.22, 0.26]	0.12	0.17	.867	1.48	0.29	4.94	0.36
Primary, unadjusted	−0.01 [−0.26, 0.24]	0.13	−0.08	.935	1.48	0.19	4.94	0.16

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	SMA – NCM slope difference				One SD below the mean		One SD above the mean	
Sample and version	b [95% CI]	SE	z	p	Score	SMA – NCM	Score	SMA – NCM
Sensitivity, adjusted	0.15 [−0.14, 0.43]	0.14	1.01	.311	1.26	0.40	4.82	0.91
Sensitivity, unadjusted	0.15 [−0.13, 0.43]	0.14	1.02	.306	1.26	0.30	4.82	0.82

Note. b = the SMA coefficient minus the NCM coefficient of abortion attitudes in the decision-quality equation, in points of the decision-quality mean (1–7) per point of abortion attitudes (1–7; higher scores are more restrictive), averaged over the two evidence conditions weighted as represented among included participants (primary adjusted: stereotypical 0.522, non-stereotypical 0.478); a positive value means a larger SMA – NCM difference among participants with more restrictive views. The abortion-attitude slope and the residual variance are free in each condition; the other three attitudes carry common slopes (adjusted versions). SE, z, p and the 95% CI: robust normal (Wald) statistics from the full robust (MLR, Huber-White) covariance, as registered. The registered read is the primary adjusted row; the other rows are reported without decisions. Conditional differences: the predicted SMA – NCM difference in decision quality at one SD below and above each version's fitted abortion-attitude mean (Score = the probed value), the other attitudes at each evidence condition's fitted means; illustrations without tests. Primary adjusted probes: abortion attitudes: fitted mean 3.21, SD 1.73, probes 1.48 and 4.94, observed range common to all six conditions 1.00 to 6.71. lavaan estimator MLR (estimator ML with robust.huber.white standard errors, missing = ml). No model variable was missing, so no auxiliary items were used. Decision for E5a (primary adjusted): not supported by all registered criteria. Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Abortion attitudes and hindsight (E5d–E5e)

Table S8.5

Abortion attitudes and the outcome effects on foreseeability and abortion likelihood: SMA – None and NCM – None slope differences with robust normal (Wald) 95% intervals, and the conditional SMA – None differences one SD below and above the mean, in the four sample and adjustment versions (E5d–E5e)

	SMA – None slope difference			NCM – None slope difference		One SD below the mean		One SD above the mean	
Sample and version	b [95% CI]	z	p	b [95% CI]	p	Score	SMA – None	Score	SMA – None
Foreseeability, 1–5 (E5d)									
Primary, adjusted	−0.03 [−0.18, 0.11]	−0.43	.668	−0.04 [−0.19, 0.11]	.607	1.48	−0.03	4.94	−0.14
Primary, unadjusted	−0.04 [−0.19, 0.10]	−0.59	.552	−0.04 [−0.19, 0.10]	.568	1.48	−0.03	4.94	−0.18
Sensitivity, adjusted	−0.10 [−0.26, 0.06]	−1.19	.235	−0.17 [−0.34, −0.01]	.042	1.26	0.09	4.82	−0.26
Sensitivity, unadjusted	−0.10 [−0.26, 0.06]	−1.24	.214	−0.17 [−0.34, −0.01]	.039	1.26	0.10	4.82	−0.27
Abortion likelihood, 0–100 (E5e)									
Primary, adjusted	−9.90 [−14.76, −5.05]	−4.00	< .001	−2.35 [−6.81, 2.11]	.302	1.48	30.97	4.94	−3.37
Primary, unadjusted	−10.66 [−15.50, −5.82]	−4.32	< .001	−2.87 [−7.33, 1.60]	.208	1.48	31.34	4.94	−5.62
Sensitivity, adjusted	−13.46 [−18.92, −8.00]	−4.83	< .001	−1.47 [−6.60, 3.66]	.575	1.26	44.91	4.82	−2.95

© 2026 Emma Marshall · CC BY-NC-SA 4.0

	SMA – None slope difference			NCM – None slope difference		One SD below the mean		One SD above the mean	
Sample and version	b [95% CI]	z	p	b [95% CI]	p	Score	SMA – None	Score	SMA – None
Sensitivity, unadjusted	−13.72 [−19.19, −8.26]	−4.92	< .001	−1.83 [−6.97, 3.32]	.486	1.26	44.81	4.82	−3.98

Note. Two single-outcome models in the E5a form, one per judgment. SMA – None: the SMA coefficient minus the no-information coefficient of abortion attitudes (higher scores are more restrictive), averaged over the two evidence conditions weighted as represented among included participants (primary adjusted, foreseeability: stereotypical 0.522, non-stereotypical 0.478; abortion likelihood: stereotypical 0.522, non-stereotypical 0.478); a positive value means a more positive SMA effect among participants with more restrictive views (the registered read of E5d and E5e). NCM – None: the same for NCM information, reported without a direction, as registered. z, p and the 95% CI: robust normal (Wald) statistics from the full robust (MLR, Huber-White) covariance, as registered. The registered read is the primary adjusted row of each band. Conditional differences: the predicted SMA – None difference in the judgment at one SD below and above each version's fitted abortion-attitude mean (Score = the probed value), the other attitudes at each evidence condition's fitted means; illustrations without tests. Primary adjusted probes, foreseeability model: abortion attitudes: fitted mean 3.21, SD 1.73, probes 1.48 and 4.94, observed range common to all six conditions 1.00 to 6.71; abortion-likelihood model: abortion attitudes: fitted mean 3.21, SD 1.73, probes 1.48 and 4.94, observed range common to all six conditions 1.00 to 6.71. lavaan estimator MLR (estimator ML with robust.huber.white standard errors, missing = ml) (both models). Foreseeability model: no model variable was missing, so no auxiliary items were used. Abortion-likelihood model: no model variable was missing, so no auxiliary items were used. Decisions (primary adjusted): E5d not supported by all registered criteria; E5e not supported by all registered criteria (E5e is gated by the stereotypicality rule, verdict "manipulated"). Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Abortion attitudes and compensatory damages (E5b)

Table S8.6

Abortion attitudes and the SMA − NCM difference in compensatory awards: two-part model probes one SD below and above the mean with participant percentile bootstrap 95% intervals (E5b)

Probe	Comparison	Delta Pr(award)	Delta positive mean	Delta expected award	95% CI
One SD below the mean (1.53)	SMA − NCM	.02	−29,795	−23,380	[−90,692, 30,439]
One SD above the mean (5.08)	SMA − NCM	.02	−13,994	−2,064	[−169,894, 430,577]
Above minus below	Difference of the two SMA − NCM differences	−.01	15,801	21,316	[−166,524, 459,710]

© 2026 Emma Marshall · CC BY-NC-SA 4.0

Probe	Comparison	Delta Pr(award)	Delta positive mean	Delta expected award	95% CI

Note. Two-part award model: a logistic part for any award and a Gamma part with log link for the positive amount, each with six condition intercepts and six abortion-attitude slopes; plaintiff and officer blame and the other three attitudes carry slopes common to the six conditions, separately in each part; one Gamma dispersion. Primary sample, adjusted. Each probe row: among included SMA and NCM participants (n = 213), the SMA – NCM difference in the predicted probability of an award, in the predicted positive award and in the expected award (their product, zeros included), each participant in their own evidence condition with equal weight, with abortion attitudes set to the probe. Probes: the sample mean (3.31) minus and plus one sample SD (1.77) of the abortion-attitude mean among those participants; both lie inside the observed range of all four SMA and NCM conditions (1.00 to 6.86). The last row subtracts the lower-score difference from the higher-score difference (registered analysis supplement). The 95% interval bounds the expected-award difference only: participant percentile bootstrap, refitting both parts and recomputing each attempt's own attitude mean and SD. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 9959 (failed attempts are not replaced). The probability and positive-award differences are descriptive parts of the same predictions and carry no interval. E5b is registered without a direction and is reported without a support gate. Decision for E5b: estimates reported; no registered decision rule. Decision: each letter's registered rule applied to its saved interval. *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

S9. The sensitivity sample

Participants in each sample

Table S9.1

Participants in each condition of the primary and sensitivity samples, and the registered exclusions between them

	Stereotypical			Non-stereotypical			
Sample or rule	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**	**All conditions**
Samples							
Primary sample	55	52	60	52	50	51	320
Sensitivity sample	32	33	45	36	29	37	212
Not retained	23	19	15	16	21	14	108
Not retained, by registered sensitivity rule							
Outcome check wrong or blank	12	9	8	10	15	11	65
Stereotypicality check wrong or blank	2	1	1	3	0	0	7
Content-recognition check wrong or blank	13	10	7	6	7	5	48
Under one-third of the median completion time	0	0	1	0	0	0	1

Note. Entries are numbers of participants (n). Counts from the analysis sample. They equal the eligibility counts and sample flow of the data preparation. Not retained = primary minus sensitivity. A participant flagged by more than one rule is counted under each, so the rule rows can add up to more than the participants not retained. No interval is estimated in this table (the percentile bootstrap, Student t and Wald intervals of the estimates are in the tables below). N = 320 (Stereotypical, None, n = 55; Stereotypical, SMA, n = 52; Stereotypical, NCM, n = 60; Non-stereotypical, None, n = 52; Non-stereotypical, SMA, n = 50; Non-stereotypical, NCM, n = 51). In the sensitivity analysis, N = 212 (Stereotypical, None, n = 32; Stereotypical, SMA, n = 33; Stereotypical, NCM, n = 45; Non-stereotypical, None, n = 36; Non-stereotypical, SMA, n = 29; Non-stereotypical, NCM, n = 37).

	Primary sample		Sensitivity sample	
Model and letters	**Adjusted, N**	**Unadjusted, N**	**Adjusted, N**	**Unadjusted, N**

Note. N = the participants the model used in that sample and version (full information maximum likelihood models use every participant; the others use the participants with every rating the model needs). Not estimable (legal-indirect, primary sample, unadjusted; legal-indirect, sensitivity sample, adjusted; legal-indirect, sensitivity sample, unadjusted): in this sample and version the model did not reach a converged, admissible solution (lavaan's convergence and post-estimation checks), so no estimates are reported. The registration requires an admissible, converged solution for an original-sample result (registered analysis supplement). Not estimable (structural-sensitivity, primary sample, unadjusted; structural-sensitivity, sensitivity sample, adjusted; structural-sensitivity, sensitivity sample, unadjusted): the equal model of the registered nested comparison did not reach a converged, admissible solution, so the comparison cannot be computed in this sample and version. No interval is estimated in this table (the percentile bootstrap, Student t and Wald intervals of the estimates are in the tables below). *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

	Primary sample			Sensitivity sample		
Record	Attempted	Usable	Minimum	Attempted	Usable	Minimum

Note. Each row is one record of bootstrap attempts: a bootstrap model in one version (adjusted = the registered model). Attempted = the participant resamples drawn within that sample, with replacement within each of the six conditions. Usable = the resamples that gave a finite value, over the model's percentile-bootstrap targets (a range when the targets differ); failed attempts are not replaced. Minimum: met when every such target has its percentile bootstrap interval under the registered rule (at least two finite resamples; the threshold model needs every attempt). Models without a bootstrap (the analyses of covariance, the profile models and the moderation models, with Student t or Wald intervals) have no attempt record. Not estimable (legal-indirect, primary sample, unadjusted; legal-indirect, sensitivity sample, adjusted; legal-indirect, sensitivity sample, unadjusted): in this sample and version the model did not reach a converged, admissible solution (lavaan's convergence and post-estimation checks), so no estimates are reported. The registration requires an admissible, converged solution for an original-sample result (registered analysis supplement). *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

	Primary sample			Sensitivity sample				
Letter and target	Estimate	CI	Decision	Estimate	CI	Decision	Interval	Verdict differs

Note. One row per letter and per target its registered decision rule reads, adjusted for the four attitudes (the registered model), with the saved estimate and interval for that target in each sample; decimals follow each row's magnitude. CI = the interval at the level and by the procedure in the Interval column (Student t; TOST Student t for the equivalence letters, at the registered 90% level; robust or sandwich Wald; the participant percentile bootstrap). A percentile bootstrap interval of the sensitivity sample uses its own 10,000 participant resamples, drawn within the sensitivity sample with replacement within each of the six conditions, from that sample's own seeded stream. Verdict differs: yes or no when both samples give a verdict (supported, not supported); — otherwise. No test compares the samples. Not estimable (legal-indirect, primary sample, unadjusted; legal-indirect, sensitivity sample, adjusted; legal-indirect, sensitivity sample, unadjusted): in this sample and version the model did not reach a converged, admissible solution (lavaan's convergence and post-estimation checks), so no estimates are reported. The registration requires an admissible, converged solution for an original-sample result (registered analysis supplement). *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51). In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Table S9.5

	Primary sample			Sensitivity sample				
Letter and target	Estimate	CI	Decision	Estimate	CI	Decision	Interval	Verdict differs

Note. One row per letter and per target its registered decision rule reads, without the attitude covariates, with the saved estimate and interval for that target in each sample; decimals follow each row's magnitude. CI = the interval at the level and by the procedure in the Interval column (Student t; TOST Student t for the equivalence letters, at the registered 90% level; robust or sandwich Wald; the participant percentile bootstrap). A percentile bootstrap interval of the sensitivity sample uses its own 10,000 participant resamples, drawn within the sensitivity sample with replacement within each of the six conditions, from that sample's own seeded stream. Verdict differs: yes or no when both samples give a verdict (supported, not supported); — otherwise. No test compares the samples. Not estimable (legal-indirect, primary sample, unadjusted; legal-indirect, sensitivity sample, adjusted; legal-indirect, sensitivity sample, unadjusted): in this sample and version the model did not reach a converged, admissible solution (lavaan's convergence and post-estimation checks), so no estimates are reported. The registration requires an admissible, converged solution for an original-sample result (registered analysis supplement). N = 320 (Stereotypical, None, n = 55; Stereotypical, SMA, n = 52; Stereotypical, NCM, n = 60; Non-stereotypical, None, n = 52; Non-stereotypical, SMA, n = 50; Non-stereotypical, NCM, n = 51). In the sensitivity analysis, N = 212 (Stereotypical, None, n = 32; Stereotypical, SMA, n = 33; Stereotypical, NCM, n = 45; Non-stereotypical, None, n = 36; Non-stereotypical, SMA, n = 29; Non-stereotypical, NCM, n = 37).
