Study Materials

Measures Across Studies

The supplement's website lists the full materials for each study on its materials page, https://emmarshall.github.io/dissertation-supplement/materials.html: the Pilot Study 1 narrative codebook and, for Pilot Study 2, Study 1 and Study 2, the vignette page participants read in each condition, with the document images that page shows. Each vignette page is the participant-facing page embedded in the survey; it also holds the instructions and the text passages participants read between the images.

Measures Across Studies

Selected stimulus images, full materials, and item wording are linked in the Pilot Study 2 materials, Study 1 materials, and Study 2 materials. The shared individual-difference scales and demographic items are in the dissertation's Individual-Difference Scales and Demographic Items section.

Table 2 lists the measures administered in each study and the changes in wording, response scale, or compositing rules between studies. All three studies shared a core of scenario-dependent judgment measures and individual-difference scales; Study 2 added several measures that the earlier studies did not include.

Table 2

Measures Administered in Pilot 2, Study 1, and Study 2, With Cross-Study Changes

Measure	Pilot 2	Study 1	Study 2	Cross-study changes
Attention checks				
Directed-response attention checks (3 items)	Yes	Yes	Yes	Identical items across all three studies
Probable-cause judgments				
Subjective-probability rating (0–100)	Yes	Yes	Yes	P2/S1: "committed the crime the detective suspects her of committing" (search-warrant context). S2: "committed reckless feticide" (arrest context). Scale anchoring identical (0–100%).

Measure	Pilot 2	Study 1	Study 2	Cross-study changes
Binary probable-cause ruling (Yes/No)	—	Yes	Yes	S1: warrant framing ("Is/Was there probable cause to justify the search?"), tensed by cell (present in foresight, past in hindsight). S2: arrest framing ("do you believe Detective Snyder had probable cause to arrest Ms. Johnston for reckless feticide?"); constant past tense. S1 gave a probable cause definition before the ruling; S2 gave pattern jury instructions.
Confidence in ruling (0–100)	—	Yes	Yes	Identical wording and scale in Studies 1 and 2
Outcome likelihood				
Outcome likelihood estimates (4 items, 0–100 each)	Yes	Yes	Yes	P2/S1: four outcomes describe search results (abortion evidence, disposal evidence, financial crime, nothing illegal). In Study 2, participants rated the likelihood of four pregnancy outcomes: (1) intentional termination through medication; (2) unintended loss resulting from her own conduct; (3) loss from a natural cause; and (4) loss from an accident, injury, or another person's actions. S2 outcome items adapted to arrest/investigation context. Hindsight cells in S1 and SMA/NCM cells in S2 include a "think back" debias instruction.
Objective-probability companion item (0–100)	—	—	Yes	New in Study 2; dual-probability paradigm from Kneer and Skoczeń (2023)
Foreseeability				
Perceived foreseeability (5 items, 1–5 Likert)	Yes	Yes	Yes	P2/S1: "what the search will/would reveal" (warrant framing); tensed by cell in S1. S2: "what the post-arrest investigation would conclude" (arrest framing); constant wording with conditional framing in None cells. Item 2 reverse-scored in all studies. Items 1–4 composited; item 5 general foreseeability.

Measure	Pilot 2	Study 1	Study 2	Cross-study changes
Decision quality				
Quality of the detective's decision (5 items, 1–7 Likert)	Yes	Yes	Yes	P2/S1: "decision to seek the warrant"; tensed by cell in S1. S2: "decision to arrest Ms. Johnston"; constant past tense. Item content otherwise parallel.
Severity				
Severity of consequences (1 item, 1–7)	Yes	Yes	Yes	Identical wording and scale across all three studies
Seriousness of the revealed crime (1 item, 1–7)	Yes[a]	—	—	Pilot 2 only; dropped in Study 1 and not used in Study 2.
Evidence ratings				
Relevance ratings (10 items, 1–9)	Yes	Yes	Yes	All studies used a 1–9 scale. Items referred to search-warrant evidence in Pilot 2 and Study 1 and to pre-arrest evidence in Study 2, with wording adapted to its stereotypical or non-stereotypical record.
Believability ratings (10 items, 1–9)	Yes	—	—	Pilot 2 only; participants rated the believability of the same 10 evidence items
Incrimination ratings (10 items, 1–9)	—	—	Yes	Study 2 only; participants also rated how incriminating the 10 evidence items were
Search endorsement				
Search-target endorsement panel (3 targets × 3 items)	Yes	Yes	—	Pilot 2 and Study 1; three search targets on an ascending-invasiveness gradient (reverse keyword warrant, text-message warrant, physical search), each with endorsement, certainty threshold, and P(evidence|guilt) items
Mens rea				
MPC mens rea ladder (4 items, 1–7 Likert)	Yes	Yes	Yes	P2/S1: "the suspect's purposeful objective" (generic suspect reference). S2: "Ms. Johnston's purposeful objective" (named suspect). Scale identical (1–7).
Moral judgment				
Mala in se rating (1 item, 1–7)	Yes	Yes	Yes	Identical wording across all three studies

Measure	Pilot 2	Study 1	Study 2	Cross-study changes
Charged-offense moral wrongness (1 item, 1–7)	Yes	Yes	Yes	Identical wording and scale across all three studies
Counterfactual availability (1 item, 1–7)	Yes	Yes	Yes	Identical wording and scale across all three studies
Suspect/plaintiff blame				
Blame (1 item, 1–7)	Yes	Yes	Yes	P2/S1: “the suspect … the outcome of the pregnancy.” S2: “Ms. Johnston … what happened.” Anchor labels shift from *to blame* to *blameworthy* in S2.
Responsibility (1 item, 1–7)	Yes	Yes	Yes	P2/S1: “the suspect … the outcome of the pregnancy.” S2: “Ms. Johnston … what happened.” Scale identical.
Punishment (1 item, 1–7)	Yes	Yes	Yes	Identical wording and scale across all three studies
Agent causality (1 item, 1–7)	Yes	Yes	Yes	P2/S1: “the suspect’s actions.” S2: “Ms. Johnston’s actions.” Scale identical.
Reasons / justification (1 item, 1–7)	Yes	Yes	Yes	P2/S1: “the suspect.” S2: “Ms. Johnston.” Scale identical.
Preventability (1 item, 1–7)	Yes	Yes	Yes	P2/S1: “the suspect.” S2: “Ms. Johnston.” Scale identical.
Spontaneous character impression (1 item, 1–7)	Yes	Yes	Yes	P2/S1: “the suspect.” S2: “Ms. Johnston.” Scale identical.
Moral wrongness of conduct (1 item, 1–7)	Yes	Yes	Yes	P2/S1: “the suspect’s conduct.” S2: “Ms. Johnston’s conduct.” Scale identical.
Detective culpability				
Detective blameworthiness (1 item, 0–10)	Yes	Yes	Yes	P2/S1: “the detective … to seek the warrant.” S2: “Detective Snyder … to arrest Ms. Johnston.” Scale identical (0–10).
Consequence severity for detective (1 item, 0–10)	Yes	Yes	Yes	P2/S1: “the detective … to seek the warrant.” S2: “Detective Snyder … to make the arrest.” Scale identical.
Right or wrong (1 item, 0–10)	Yes	Yes	Yes	P2/S1: “the detective’s decision to seek the warrant.” S2: “Detective Snyder’s decision to make the arrest.” Scale identical.

Measure	Pilot 2	Study 1	Study 2	Cross-study changes
Sympathy				
Sympathy for suspect/ plaintiff (1 item, 1–7)	—	—	Yes	New in Study 2
Damages				
Compensatory damages (numeric write-in, USD)	—	—	Yes	New in Study 2; civil-trial damages paradigm
Punitive damages (numeric write-in, USD)	—	—	Yes	New in Study 2; civil-trial damages paradigm
Manipulation checks				
Vignette comprehension check	Yes	Yes	—	P2/S1: three-option checkbox (two true, one false distractor). Not carried to S2; replaced by content-recognition check.
Outcome manipulation check	—	Yes	Yes	S1: “Which of the following best describes what the authorized search revealed?” (4 options). S2: “Did the case file include a summary of what investigators found after the arrest?” (4 options, arrest framing).
Legal context manipulation check	—	Yes	—	Study 1 only; checks statute identification (criminal abortion vs. improper disposal)
Gestational-age estimate	Yes	Yes	—	Pilot 2 and Study 1; participants estimated gestational age
Stereotypicality manipulation check	—	—	Yes	Study 2 only; checks perception of stereotypical vs. non-stereotypical fact pattern
Content-recognition check	—	—	Yes	Study 2 only; identifies a fact NOT in the case scenario
Individual-difference scales				
Modified Abortion Attitudes Scale (14 items, 1–7)	Yes	Yes	Yes	Same items across all three studies; Studies 1 and 2 scored the scale in the opposite direction from Pilot 2 (higher = more restrictive); see the dissertation’s Individual-Difference Scales and Demographic Items section
Support for Punishment of Women for Miscarriage (6 items, 1–7)	Yes	Yes	Yes	Identical scale across all three studies; see the dissertation’s Individual-Difference Scales and Demographic Items section

Measure	Pilot 2	Study 1	Study 2	Cross-study changes
Ambivalent Sexism Inventory — Short Form (12 items, 0–5)	Yes	Yes	Yes	Identical scale across all three studies; see the dissertation's Individual-Difference Scales and Demographic Items section
Religiosity Scale (4 standardized items)	Yes	Yes	Yes	Identical scale across all three studies; see the dissertation's Individual-Difference Scales and Demographic Items section
Political orientation (1–7) and party affiliation (6 response options)	Yes	Yes	Yes	Identical items across all three studies; see the dissertation's Individual-Difference Scales and Demographic Items section
Outcome Preference Measure (1 forced-choice item)	Yes	Yes	Yes	Identical item across all three studies; see the dissertation's Individual-Difference Scales and Demographic Items section
Demographics	Yes	Yes	Yes	Core items identical; Study 2 adds federal-jury-eligibility item; see the dissertation's Individual-Difference Scales and Demographic Items section

Note. Yes = administered; — = not administered. Three structural differences run through the table. First, Pilot 2 and Study 1 used a search-warrant paradigm, in which the detective sought a warrant and participants evaluated the search, whereas Study 2 used an arrest paradigm, in which the detective arrested the suspect and participants served as jurors evaluating probable cause and damages; the referent wording changed accordingly. Second, Pilot 2 and Study 1 referred to "the suspect," whereas Study 2 named the suspect (Ms. Johnston) and the detective (Detective Snyder). Third, Study 1 tensed its items by cell (present or future tense in foresight, past tense in hindsight), whereas Study 2 used the past tense throughout, with a conditional framing ("as if you did not know") in the no-outcome condition. Individual-difference scale items and attention checks were identical across the three studies.

[a] The seriousness-of-the-revealed-crime item was administered only after the search outcome information, once participants had seen what the search revealed.

Pilot Study 1

Pilot Study 1 Design and Materials
Registered Analytic Models and Hypotheses
Pilot 1 Supplementary Analyses
Verdicts, Mental State and Legal Accuracy

About this document

This part includes the supplementary analyses for Pilot Study 1. The Pilot Study 1 materials include the registered models and hypotheses, narrative-coding reliability checks, and exploratory analyses supporting Chapter 5.

Pilot Study 1 Design and Materials

Pilot Study 1 combined narrative writing, card sorting, and individual-difference measures. I assigned each participant to one of four verdict conditions for the narrative task; within that condition, participants wrote about all four crime prompts. They then evaluated the same set of 20 cards and completed the attitude measures and demographics. Table P1.1 links the tasks and coding materials, and Figure P1.1 separates the participant sequence from narrative coding after collection.

Table P1.1

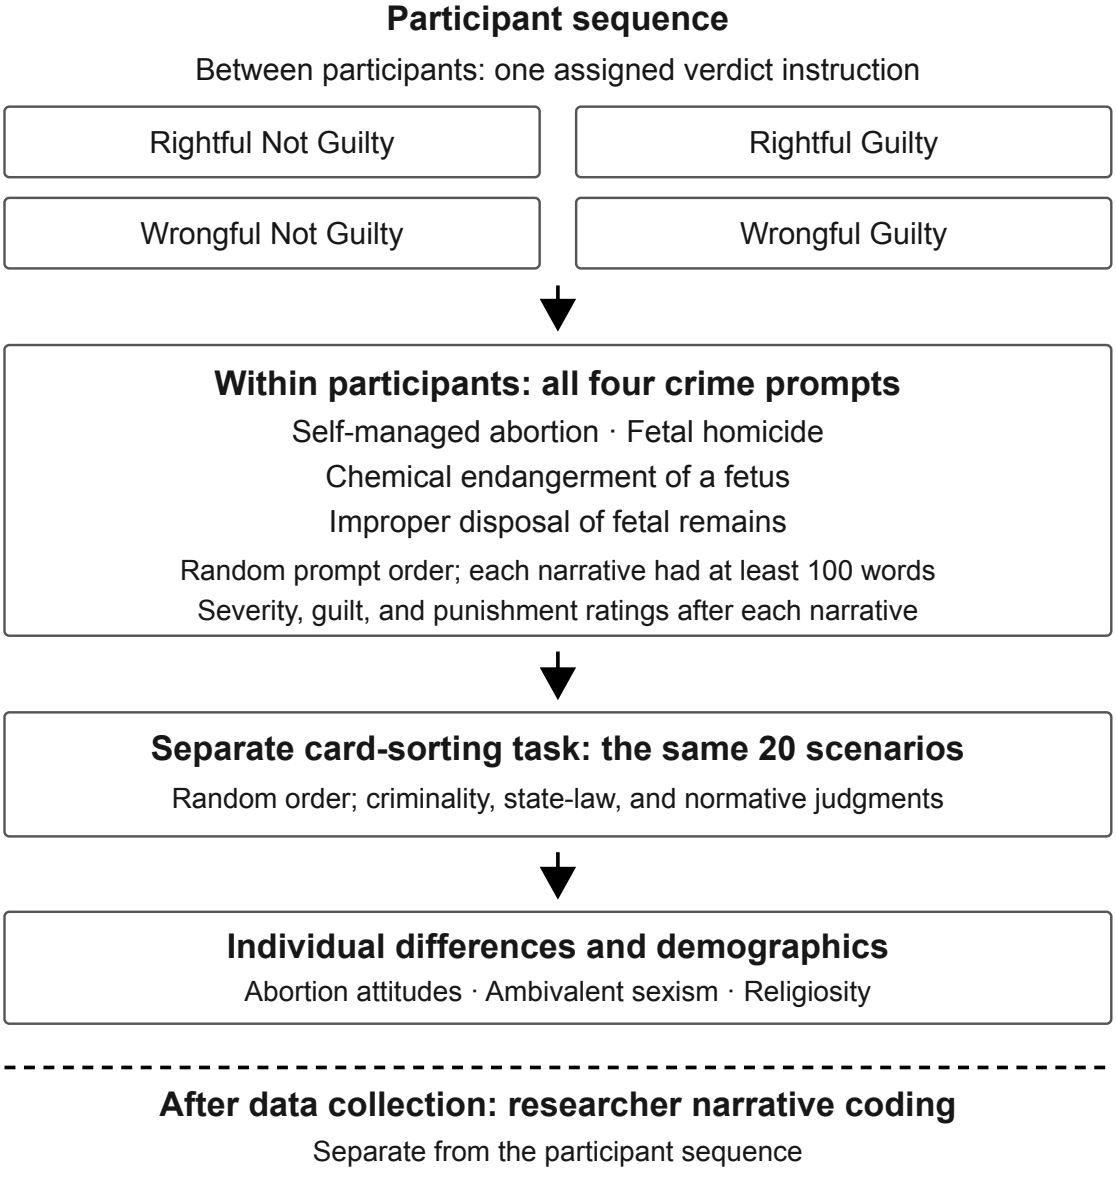

Pilot Study 1 Design and Materials

Component or condition	Design / what the participant received	Materials
Study design	Narrative task: four assigned verdict conditions between participants × four repeated crime prompts within participants. Card sorting used a separate fixed set of 20 scenarios.	Figure P1.1
Narrative writing	Rightful Not Guilty, Rightful Guilty, Wrongful Not Guilty, or Wrongful Guilty. Participants wrote four narratives of at least 100 words in random prompt order and rated crime severity, guilt likelihood, and punishment after each.	Task description; measures
Card sorting	All participants evaluated the same 20 scenarios in random order, answering general criminality, descriptive state-law, and normative criminality questions for each.	All 20 scenario cards; questions and response options
Individual differences	After the two tasks: abortion attitudes, ambivalent sexism, religiosity, and demographics.	Measures
Narrative coding	Researcher coding of the collected narratives, separate from participants' survey tasks.	Narrative codebook and coding instructions

Note. The four verdict conditions applied to the narrative task. The card set was a fixed repeated set of scenarios; its features were not a complete crossing of experimental factors.

Figure P1.1

Pilot Study 1 Design and Task Sequence

Note. Each participant retained one verdict instruction across the four narrative prompts. Researcher narrative coding occurred after collection and was separate from the participant sequence.

The registered task description gives the full instructions and all 20 cards; the registered measures give the questions and response options. The narrative coding workbook contains the codebook and coding instructions. These files are also linked from the study materials hub.

Card-Sorting Task Materials

The card-sorting task is described in the Pilot 1 Method in Chapter 5 of the dissertation. In brief, I presented 20 short pregnancy-related experiences in random order, adapting the card-sort method of VandeVusse et al. (2023). Participants answered three questions about each card, each with three response options: whether the scenario could describe a crime, whether it is a crime where they live, and whether it should be. The three questions are my own. After sorting all 20 cards, participants picked the five they had found hardest to sort and wrote a brief explanation for each.

Table P1.2 lists the 20 card stems with the six features I coded for each: the mental-state cue, medical intervention, gestational age, method, care-seeking, and pregnancy outcome.

Table P1.2

Pilot 1 Card-Sort Scenarios and Feature Codes

#	Experience description	Mental state	Medical intervention	Gestation	Method type	Care-seeking	Outcome
1	Took abortion pills ordered online after a positive pregnancy test	Purposeful	No	Unsp.	Pills-online	None	Terminated
2	Took abortion pills prescribed by a healthcare provider	Purposeful	Yes	Unsp.	Pills-prescribed	Sought	Terminated
3	Had a surgical abortion at a clinic	Purposeful	Yes	Unsp.	Surgical	Sought	Terminated
4	Took abortion pills before taking a pregnancy test	Ambiguous	No	Unsp.	Pills-online	None	Unknown
5	Experienced a miscarriage	None	No	Unsp.	None	None	Loss
6	Had a stillbirth	None	No	Late	None	None	Loss
7	Had medical management (pills) for a miscarriage at 12 weeks	None	Yes	12w	Pills-managed	Sought	Loss

#	Experience description	Mental state	Medical intervention	Gestation	Method type	Care-seeking	Outcome
8	Had surgical management (D&C procedure) for a miscarriage at 8 weeks	None	Yes	8w	Surgical	Sought	Loss
9	Disposed of fetal remains at home after a miscarriage	Ambiguous	No	Unsp.	None	None	Loss
10	Disposed of fetal remains at home after taking abortion pills	Purposeful	No	Unsp.	Pills-online	None	Terminated
11	Used substances during pregnancy that caused fetal death	Reckless	No	Unsp.	Substance	None	Loss
12	Got into an accident while pregnant that caused fetal death	Accidental	No	Unsp.	Accident	None	Loss
13	Had an ectopic pregnancy removed	None	Yes	Unsp.	Surgical	Sought	Terminated
14	Missed a period	None	No	Unsp.	None	None	None
15	Took emergency contraception (Plan B)	None	No	Pre-impl.	Plan B	None	None
16	Attempted to end pregnancy using herbs but pregnancy continued	Purposeful	No	Unsp.	Herbs	None	Continued

#	Experience description	Mental state	Medical intervention	Gestation	Method type	Care-seeking	Outcome
17	Searched online for information about abortion pills	Ambiguous	No	Unsp.	Information	None	None
18	Told a friend they didn't want to be pregnant	None	No	Unsp.	Expression	None	None
19	Delayed seeking prenatal care	Negligent	No	Unsp.	Delay-prenatal	Delayed	Unknown
20	Did not immediately seek medical care after pregnancy loss	Negligent	No	Unsp.	Delay-post	Delayed	Loss

Registered Analytic Models and Hypotheses

Analytic Models.

I conducted all analyses in R (R Core Team, 2026). Each research question was tested with its own model. Chi-square tests of independence compared the content of the narratives across the four crime categories (RQ1) and across the four verdict conditions (RQ2). These tests covered the 67 automated features (i.e., the Phase 1 and Phase 2 codes), with the Benjamini–Hochberg correction applied across that family. The 14 holistic codes (i.e., the Phase 3 codes) are complete. However, only one provided interpretable evidence that the preregistered reliability target had been met. I therefore used the holistic codes only in the analyses of mitigating and aggravating factors and mental states (H2a, H2b, H2c, and H3a), and I treat every result that rests on a holistic code as exploratory. I report Cramér's *V* with a 95% confidence interval for each variable.

A within-subjects one-way ANOVA tested whether post-narrative severity ratings differed across the four crime categories (RQ3, H3b). Each participant gave four ratings, one for each crime category. I applied the Greenhouse–Geisser correction when sphericity was violated. I fit the ANOVA with the afex package, computed estimated marginal means and planned contrasts with emmeans (Lenth & Piaskowski, 2017), and computed effect sizes with the effectsize package. Registered planned contrasts and main effects were tested at $\alpha = .05$ without adjustment. The one exception was the follow-up of interactions. I corrected the simple effects that probe the interaction of verdict condition and factor type (H2b) within that family. I used Tukey's HSD when the follow-up compared all pairs of estimated marginal means and the Bonferroni correction when it tested a specified subset.

Two multiple regressions tested whether scores on the Modified Abortion Attitudes Scale predicted each participant's mean severity and mean punishment ratings across the four crime categories (RQ4, H4). Age, political orientation, and religiosity were covariates. I compared the card-sort consensus with the preregistered threshold descriptively (RQ5). Mixed-effects logistic regressions tested whether the features of each scenario predicted the binary judgment that the scenario was "definitely yes, this is a crime" (H5). Each model had a random intercept for participants. I fit these models with the lme4 and lmerTest packages. A pooled McNemar's test across the 20 scenarios compared descriptive and normative crime judgments (RQ6, H6). The legal-accuracy analysis used one-sample binomial tests against chance (.50), for each scenario and pooled across scenarios. I computed the McNemar and exact binomial tests with the exact2x2 package. Two mixed-effects logistic regressions of the card-sort crime judgments tested the attitude hypotheses (RQ7, H7a and H7b). The first model pooled the two

judgment types. The second added the interaction of abortion attitudes and judgment type. Both models had crossed random intercepts for participants and scenarios, and both were fit with lme4 and lmerTest.

I report effect sizes (i.e., partial η^2, Cramér's *V*, and odds ratios) and 95% confidence intervals for all tests. The cluster analysis is exploratory. It used partitioning around medoids on Gower distance within each crime category. I fit it with the cluster package and evaluated it with the silhouette width and the gap statistic. I computed scale descriptives and reliability coefficients with the psych package. The text analyses of the narratives used quanteda (Benoit et al., 2018), with quanteda.textstats and quanteda.textplots for keyness and text statistics and udpipe for linguistic annotation. I computed inter-rater reliability (i.e., Cohen's and Fleiss's kappa) with the irr package.

The two kinds of mixed-effects logistic regression take the following multilevel form. In the feature-prediction models (H5), crime judgments i are nested within participants j. Each scenario feature F enters as a single Level-1 predictor:

$$\begin{aligned}
&\text{Level 1:} \quad \operatorname{logit}\big(\Pr(\text{crime}_{ij}=1)\big) = \beta_{0j} + \beta_1 F_{ij} \\
&\text{Level 2:} \quad \beta_{0j} = \gamma_{00} + u_{0j}, \quad u_{0j} \sim \mathcal{N}(0, \tau^2_{\text{participant}}).
\end{aligned}$$

The attitude models (H7a and H7b) cross each judgment with both participants j and scenarios k. Standardized abortion attitudes (AAS_j) enter as a participant-level (Level-2) predictor, and judgment type (descriptive vs. normative) enters as a Level-1 predictor:

$$\begin{aligned}
&\text{Level 1:} \quad \operatorname{logit}\big(\Pr(\text{crime}_{ijk}=1)\big) = \beta_{0jk} + \beta_{1jk}\,\text{JudgmentType}_{ijk} \\
&\text{Level 2:} \quad \beta_{0jk} = \gamma_{00} + \gamma_{01}\,\text{AAS}_j + u_{0j} + v_{0k} \\
&\qquad\qquad \beta_{1jk} = \gamma_{10} + \gamma_{11}\,\text{AAS}_j \\
&\qquad\qquad u_{0j} \sim \mathcal{N}(0, \tau^2_{\text{participant}}), \quad v_{0k} \sim \mathcal{N}(0, \tau^2_{\text{scenario}}).
\end{aligned}$$

H7b tests whether the association between abortion attitudes and crime judgments differs by judgment type (γ_{11}). H7a tests the main-effects model, in which $\gamma_{11} = 0$.

Hypotheses.

I grouped the seven preregistered Pilot 1 questions by the judgments participants made. RQ1 to RQ3 concerned the narratives: whether their features, mitigating and aggravating factors, and attributed mental states differed across crime categories and verdict conditions. RQ4 and RQ7 concerned abortion attitudes, measured with the Modified Abortion Attitudes Scale, as predictors of severity, punishment, and card-sort crime judgments. I predicted a stronger association with normative than descriptive judgments. The card-sort analyses (RQ5 and RQ6)

tested whether at least four scenarios met the preregistered criterion for broad disagreement, whether the features of the scenarios predicted the crime judgments, and whether descriptive and normative judgments diverged. The full hypothesis statements and analysis plan are in the preregistration on the study's OSF page.[1]

Table P1.3 lists the primary hypotheses of Pilot 1 by research question.

Table P1.3

Pilot 1 primary hypotheses by research question.

Hypothesis Number	*Hypothesis Title*	*Hypothesis*	*Outcome*
Hypotheses relating to narrative prototypes (RQ1)			
H1	Crime-category differences on narrative features	I predicted that the four crime categories would differ in the narrative features people wrote about, each category showing a distinct profile across the coded dimensions.	Supported
Hypotheses relating to verdict condition and narrative content (RQ2)			
H2a	Verdict Condition on Total Factor Count	I predicted that participants would write longer, more elaborated narratives under the wrongful-verdict instructions than under the rightful-verdict instructions.	Not supported
H2b	Verdict Condition × Mitigating vs. Aggravating Factors	I predicted that this wrongful-versus-rightful elaboration difference would be larger for mitigating detail than for aggravating detail.	Not supported
H2c	Mental State by Actual Culpability	I predicted that narratives whose underlying facts implied guilt would contain more purposeful or knowing intent signals than narratives whose facts implied innocence.	Not supported[a]

[1]Departures from the registration are recorded in the deviations record, included in this supplement (https://doi.org/10.5281/zenodo.23424192).

Hypothesis Number	*Hypothesis Title*	*Hypothesis*	*Outcome*
Hypotheses relating to mental state and severity across crime categories (RQ3)			
H3a	Mental State × Crime Category	I predicted that intent signals would vary by crime category, with self-managed-abortion narratives skewing toward purposeful or knowing intent and chemical-endangerment narratives toward reckless or negligent intent, and fetal homicide and improper disposal showing their own profiles.	Supported[a]
H3b	Crime Category on Severity	I predicted that perceived severity would differ across the four categories, with fetal homicide and chemical endangerment rated more severe than self-managed abortion and improper disposal of remains.	Not supported
Hypotheses relating to abortion attitudes and post-narrative ratings (RQ4)			
H4	Attitudes on Severity and Punishment	I predicted that more restrictive abortion attitudes would predict higher severity ratings and harsher recommended punishment, controlling for demographics.	Supported
Hypotheses relating to scenario features and crime classification (RQ5)			
H5	Scenario-Feature Predictors	I predicted that mental-state cues and medical-intervention status would be the two strongest scenario-feature predictors of crime judgments, followed by gestational age, with method type, care-seeking, and pregnancy outcome as smaller predictors.	Not fully evaluated[b]

Hypothesis Number	*Hypothesis Title*	*Hypothesis*	*Outcome*
Hypothesis relating to descriptive versus normative judgments (RQ6)			
H6	Descriptive–Normative Divergence	I predicted a gap between what people thought the law is and what they thought it should be, such that more scenarios were judged crimes under current law than people thought should be crimes.	Not supported[c]
Hypotheses relating to abortion attitudes and crime judgments (RQ7)			
H7a	Attitudes on Crime Judgments	I predicted that more restrictive abortion attitudes would raise the odds of classifying a scenario as a crime, across both kinds of judgment, controlling for demographics.	Supported
H7b	Attitudes × Judgment Type Interaction	I predicted that the attitude effect would be larger for judgments of what should be a crime than for judgments of what currently is one.	Supported

Note. The exploratory and descriptive analyses are listed in the analysis plan and are not shown here. [a] The coded mental-state variable fell below its preregistered reliability threshold (ICC = .67 against a target of .80); results resting on it are exploratory. [b] Gestational age could not be estimated (deviation item 5). Method type was recoded as abortion-pill use, coded yes for the four scenarios that involved abortion pills and no for the rest, including the scenarios with pills for miscarriage management or emergency contraception. The separate models' likelihood-ratio statistics did not establish uniquely strongest or weakest features, and the full H5 ordering was not evaluated. Post-hoc prediction checks, including the original method categories, appear under Scenario-Feature Prediction Checks (H5). [c] The judgments diverged reliably, but opposite to the registered direction: more scenarios were endorsed as conduct that should be criminal than as currently criminal.

Pilot 1 Supplementary Analyses

This section reports the checks on the narrative coding, the reliability of the holistic codes, the distributions of the ratings, the pairwise comparisons of the crime categories, the scenario-feature prediction checks, and the exploratory analyses. Chapter 5 reports the main descriptive statistics, reliabilities, and results for each research question.

Validation and Reliability of the Narrative Coding

The narrative codes were assigned in three phases. The Phase 2 application flagged 1,718 of 7,464 code cells in the 311 reporting narratives; Phase 1 flagged 0 of 13,373. Table P1.4 shows the cutoff for each phase, and Table P1.5 shows the inter-rater reliability of the holistic Phase 3 codes. The keyness analyses in Table P1.6 and Table P1.7 serve as a convergent check on the coding. They show the words that most set each crime category apart from the others.

Table P1.4

Pilot 1 per-phase certainty-threshold calibration (added analysis, not registered).

Phase	Cutoff	n accepted	n routed	Precision	Recall	F1
Phase1	0.00	2190	0	0.58	0.59	0.58
Phase2	0.30	767	0	0.88	0.68	0.77

Note. The cutoff per phase was to maximize F1 subject to a recall floor of .80, calibrated on a hand-coded 100- to 200-narrative sub-sample; where no cutoff met the floor, the cutoff with the highest recall was used. Codes at or above the cutoff are accepted automatically; codes below are designated for Phase 3 review.

Table P1.5

Pilot 1 Phase 3 holistic-coding inter-rater reliability on the double-coded subsample.

	Primary reliability					Decision	
Holistic code	**Statistic**	**Estimate**	**95% CI**	**Registered κ**	**n**	**Target**	**Met**
Socioeconomic status†	ICC	.62	[−.41, .94]	.25	6	.80	—
Defendant sympathy (1-5)	ICC	.58	[.37, .73]	—	57	.80	No
Pregnancy wantedness	ICC	.55	[.21, .77]	.25	25	.80	No
Mens rea category	ICC	.67	[.50, .80]	.43	55	.80	No

Holistic code	Primary reliability					Decision	
	Statistic	Estimate	95% CI	Registered κ	n	Target	Met
Partner role framing†	ICC	.96	[.85, .99]	.84	9	.80	—
Healthcare-provider role framing†	ICC	.57	[−.09, .88]	.23	10	.80	—
Other-actor culpability	κ	.56	[.18, .85]	—	57	.75	No
Mitigating character framing	κ	.14	[.00, .41]	—	57	.75	No
Mitigating fetal-value framing	κ	.24	[−.08, .68]	—	57	.75	No
Aggravating callousness framing	κ	.79	[.50, 1.00]	—	57	.75	Yes
Evidentiary balance (1-3)	ICC	.28	[.03, .50]	—	56	.80	No
Factual ambiguity	κ	.22	[−.08, .52]	—	57	.75	No
Verdict consistency (1-3)	ICC	.37	[.10, .59]	—	46	.80	No

Note. Each estimate appears with its 95% confidence interval and the number of double-coded narratives contributing to it. I used Cohen's kappa for the binary codes and the intra-class correlation for ordinal and dimensional codes. Five codes had ordered values, so I treated them as ordinal. For these codes, I report both the registered unweighted kappa and the ICC, excluding the not-specified value from each estimate. The preregistered target is kappa >= .75 (binary) or ICC >= .80 (ordinal/dimensional). Media framing was invariant across the subsample, so no coefficient is defined. † Too few narratives specified the construct for both coders to score it; these estimates are reported for completeness and are not reliability evidence in either direction.

Table P1.6

Pilot 1 top-10 keyness terms per crime category, computed as a within-category target versus all-other-categories reference comparison on the narrative document-feature matrix.

Term	chi-square	p	n (target)	n (reference)
Self-managed abortion				
online	65.80	< .001	26	2
pills	57.10	< .001	42	20
medication	49.76	< .001	23	4
ordered	35.11	< .001	15	1
bleeding	28.49	< .001	21	10
access	27.87	< .001	18	7
complications	22.87	< .001	13	3
without	21.01	< .001	23	17
took	20.79	< .001	27	23
healthcare	20.26	< .001	12	3
Fetal homicide				
accident	135.66	< .001	46	1
driving	85.49	< .001	28	0
car	77.92	< .001	30	3
injuries	56.24	< .001	20	1
crash	47.90	< .001	17	0
road	47.90	< .001	17	0
vehicle	42.45	< .001	18	2
argument	41.52	< .001	19	4
fall	36.53	< .001	16	2
traffic	35.71	< .001	13	0
Chemical endangerment				
positive	90.94	< .001	32	1
use	77.71	< .001	39	10
tested	62.80	< .001	21	0
addiction	59.81	< .001	20	0
exposure	59.81	< .001	20	0

Term	chi-square	p	n (target)	n (reference)
test	57.76	< .001	25	4
system	51.03	< .001	25	6
meth	31.99	< .001	12	0
methamphetamine	29.01	< .001	11	0
continued	27.81	< .001	12	1
Improper disposal				
remains	200.38	< .001	66	1
trash	97.91	< .001	40	6
dumpster	85.13	< .001	29	1
bag	77.46	< .001	28	2
miscarriage	52.93	< .001	37	19
shock	41.16	< .001	16	1
know	37.62	< .001	35	25
behind	27.93	< .001	14	3
threw	25.34	< .001	12	2
proper	25.07	< .001	13	3

Note. Chi-square is the standard keyness chi-square statistic (positive: term is distinctively more common in the target category than in the reference corpus). n (target) and n (reference) are the raw token counts in the target and reference corpora. Added analysis, not registered: a term enters only if it appears in at least two of the 311 narratives.

Table P1.7

Pilot 1 top-10 verb and adverb keyness terms per crime category, computed on the lemma-collapsed verb-and-adverb-only document-feature matrix.

Lemma	chi-square	p	n (target)	n (reference)
Self-managed abortion				
online	53.54	< .001	22	2
order	40.12	< .001	17	1

continue	28.90	< .001	16	5
stop	23.74	< .001	15	6
smoke	16.94	< .001	7	0
repeat	14.01	< .001	6	0
addict	11.09	< .001	5	0
hospitalize	8.20	.004	4	0
knowingly	6.30	.012	18	25
miss	5.64	.018	5	2
Improper disposal				
throw	76.22	< .001	27	2
wrap	29.00	< .001	13	2
place	25.74	< .001	13	3

Lemma	chi-square	p	n (target)	n (reference)
discover	22.38	< .001	27	25
handle	20.42	< .001	13	5
bury	20.42	< .001	9	1
know	17.64	< .001	47	69
panic	17.13	< .001	9	2
hide	15.22	< .001	11	5
violate	13.32	< .001	11	6

Note. Chi-square is the standard keyness chi-square statistic (positive: lemma is distinctively more common in the target category than in the reference corpus). n (target) and n (reference) are the raw token counts in the target and reference corpora. Added analysis, not registered: a lemma enters only if it appears in at least two of the 311 narratives.

Per-Feature Chi-Square Results (Crime Category)

Table P1.8 reports the per-feature chi-square tests behind H1, with the Benjamini–Hochberg-adjusted *p* value; rows are sorted by adjusted *p*. The tests and adjustment cover the automated features only; I did not enter the 14 human-coded holistic variables into the confirmatory family because only one of them provided interpretable evidence of adequate reliability and I had not completed the required refinement and recoding.

Table P1.8

Pilot 1 Narrative Features by Crime Category (H1)

Variable	*n*	chi-square	*df*	Cramer's *V*	95% CI	*p* (BH)

trial	311	0.38	3	.00	[.00, 1.00]	.944

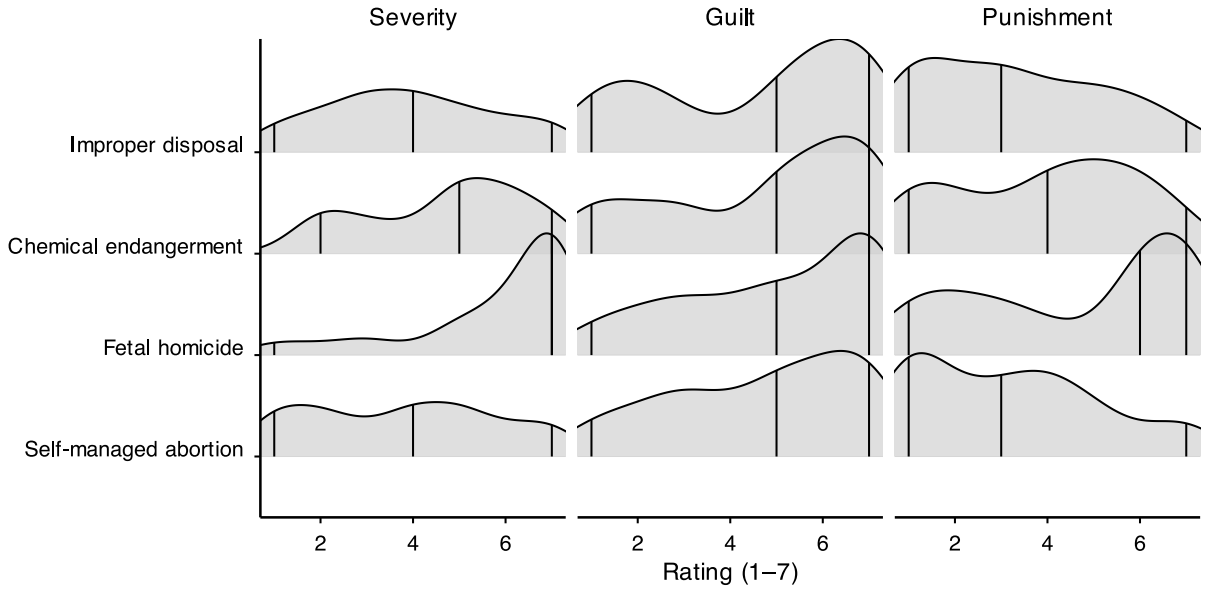

Note. Cramer's V is reported with its 95% confidence interval; p (BH) = p-value adjusted with the Benjamini-Hochberg procedure across the tested features. * BH-adjusted p < .05. Not tested (no variance across narratives): realcase, legalambig.

Rating Distributions by Crime Category

The figure below shows the distributions of the post-narrative severity, guilt, and punishment ratings by crime category. Chapter 5 of the dissertation refers to this figure.

Figure P1.2

Pilot 1 distributions of post-narrative severity, perceived guilt, and recommended punishment ratings (1–7) by crime category.

Note. Lines mark the 2.5th, 50th, and 97.5th percentiles.

Crime-Category Pairwise Comparisons

Table P1.9 reports the pairwise comparisons that followed the H3b within-subjects ANOVA, using Fisher's least significant difference procedure (Levin et al., 1994); the table also shows Tukey-adjusted *p* values.

Table P1.9

Pilot 1 pairwise comparisons of mean severity ratings (1–7) across the four crime categories, from the H3b within-subjects ANOVA.

Comparison	Difference	t(80)	p	p (Tukey)
Self-managed abortion – Fetal homicide	−1.98	−8.40	< .001	< .001
Self-managed abortion – Chemical endangerment	−0.88	−3.77	< .001	.002
Self-managed abortion – Improper disposal	−0.14	−0.62	.536	.925
Fetal homicide – Chemical endangerment	1.10	6.00	< .001	< .001
Fetal homicide – Improper disposal	1.84	7.57	< .001	< .001
Chemical endangerment – Improper disposal	0.74	3.35	.001	.007

Note. Difference is the first category's estimated marginal mean minus the second's. Following a significant omnibus test of crime category ($F(2.75, 220.01) = 32.90$, $p < .001$, Greenhouse–Geisser corrected), the comparisons used Fisher's least significant difference (LSD) procedure: a pair is significant when its own, unadjusted p is below .05. The Tukey-adjusted p values provide a familywise-error check for these four categories, for which Fisher's LSD procedure does not control the familywise error rate at .05 (Levin et al., 1994).

Scenario-Feature Prediction Checks (H5)

How accurately did each feature predict the crime judgments of participants who had not contributed to its fitted model? I report the prediction comparison as a post-hoc analysis. The likelihood-ratio statistics in the main analyses used different degrees of freedom and did not establish uniquely strongest or weakest features.

I compared separate logistic models, `is_crime ~ feature + (1 | participant_id)`, for the five reported feature codings and the original 13-level method variable. The latter checked the recoding of method as abortion-pill use; gestational age remained untested. I used a binary outcome: definite Yes = 1; No or Maybe = 0. In five-fold cross-validation, I kept each participant's 20 responses together, fitting each model to 64 or 65 of the 81 participants and predicting responses for the omitted group. The predictions averaged over the fitted normal distribution of participant intercepts. For a training category containing only zeros or only ones, I used a probability of 0 or 1, respectively, without a finite category coefficient.

Mental state and the original method variable had lower prediction errors than pregnancy outcome, care-seeking, abortion-pill use, and medical intervention (Table P1.10; Table P1.11). The interval comparing mental state with original method included zero. Medical intervention ranked last among the five reported codings; its intervals against pregnancy outcome, care-seeking, and abortion-pill use nevertheless included zero.

Table P1.10

Pilot 1 Prediction Error for the Scenario-Feature Models

Feature	Brier score
Mental-state cue	0.07735
Original method type	0.07803
Pregnancy outcome	0.08995
Care-seeking	0.09069
Abortion-pill use	0.09107
Medical intervention	0.09173
Intercept-only reference	0.09270

Note. Brier score = mean squared error of the predicted probabilities for the binary crime judgment. Lower scores indicate better prediction. Scores give equal weight to all 20 scenarios; the intercept-only reference is excluded from the six-feature comparison.

Table P1.11

Pilot 1 Differences in Brier Scores Between Feature Models

Model A	Model B	Difference	95% interval
Mental-state cue	Medical intervention	−0.01438	[−0.02239, −0.00638]
Mental-state cue	Abortion-pill use	−0.01372	[−0.02126, −0.00618]
Mental-state cue	Care-seeking	−0.01334	[−0.02074, −0.00594]
Mental-state cue	Pregnancy outcome	−0.01260	[−0.01962, −0.00558]
Mental-state cue	Original method type	−0.00068	[−0.00283, 0.00147]
Medical intervention	Abortion-pill use	0.00066	[−0.00150, 0.00282]
Medical intervention	Care-seeking	0.00104	[−0.00004, 0.00212]
Medical intervention	Pregnancy outcome	0.00178	[−0.00079, 0.00434]
Medical intervention	Original method type	0.01370	[0.00575, 0.02165]
Abortion-pill use	Care-seeking	0.00038	[−0.00157, 0.00233]
Abortion-pill use	Pregnancy outcome	0.00112	[−0.00075, 0.00298]
Abortion-pill use	Original method type	0.01304	[0.00554, 0.02054]
Care-seeking	Pregnancy outcome	0.00074	[−0.00149, 0.00297]
Care-seeking	Original method type	0.01266	[0.00532, 0.02000]
Pregnancy outcome	Original method type	0.01192	[0.00475, 0.01910]

Note. Difference = Model A – Model B in Brier scores; negative values favor A. CIs = approximate simultaneous 95% intervals for the 15 pairs, conditional on the original folds (999 bootstrap repetitions of model fitting and prediction, resampling participants with replacement within folds and keeping their 20 responses together).

Sensitivity Checks

Table P1.12

Pilot 1 Sensitivity Checks for the Scenario-Feature Prediction Ranking

Sensitivity check	Result
Ten participant splits	The six-model ranking was unchanged.
Omission of each of the 20 scenarios	Mental state and original method remained first or second. Their order and the model with the highest error varied.
Alternative coding	The ranking changed when Maybe counted with Yes and, in a separate check, when scenario 11 changed from Reckless to Negligent.

Sensitivity check	Result
Hypothetical rare Yes responses for the five scenarios with no definite-Yes judgments; predictions held fixed	Mental state's smaller advantage over original method could reverse. Its advantage over medical intervention remained.

Sought care coincided with medical intervention, and delayed care with negligence. These models do not identify independent or causal effects. Prediction on new scenarios was not tested.

Exploratory Analyses and Legal Accuracy

Table P1.13

Pilot 1 exploratory mixed-effects logistic regression of crime judgments from standardized abortion attitudes, state-law status, judgment type, and all two- and three-way interactions, with crossed participant and scenario random intercepts.

Term	OR	95% CI	z	p
Intercept	0.02	[0.01, 0.06]	−7.27	< .001
Abortion attitudes (z)	1.01	[0.70, 1.45]	0.03	.977
State law (crime in state)	2.61	[1.40, 4.87]	3.03	.002
Judgment type: Normative	1.45	[1.09, 1.95]	2.51	.012
Attitudes x State law	0.69	[0.41, 1.14]	−1.44	.150
Attitudes x Judgment type	0.45	[0.34, 0.61]	−5.36	< .001
State law x Judgment type	0.37	[0.17, 0.80]	−2.51	.012
Attitudes x State law x Judgment type	0.28	[0.13, 0.63]	−3.09	.002

Note. OR = odds ratio (exponentiated fixed coefficient); 95% CI = Wald interval on the OR scale. Reference levels are descriptive judgment and conduct not currently criminal in the participant's state.

Table P1.14

Pilot 1 Multiple Regressions of Participant Mean Severity, Guilt, and Punishment

outcome	Predictor	β	95% CI	t	p
Severity	Benevolent sexism	0.01	[−0.23, 0.25]	0.09	.926
Severity	Hostile sexism	0.03	[−0.21, 0.26]	0.23	.815
Severity	Religiosity	0.35	[0.14, 0.57]	3.23	.002
Guilt	Benevolent sexism	0.03	[−0.23, 0.28]	0.21	.838

outcome	Predictor	β	95% CI	t	p
Guilt	Hostile sexism	−0.05	[−0.30, 0.20]	−0.43	.668
Guilt	Religiosity	0.07	[−0.17, 0.30]	0.56	.577
Punishment	Benevolent sexism	−0.03	[−0.28, 0.22]	−0.21	.831
Punishment	Hostile sexism	0.19	[−0.06, 0.43]	1.53	.131
Punishment	Religiosity	0.16	[−0.07, 0.38]	1.36	.177

Note. I entered standardized benevolent sexism, hostile sexism, and religiosity together in each regression. β = standardized coefficient adjusted for the other two predictors; 95% CI = Wald interval. t tests use 77 residual df.

Table P1.15

Pilot 1 proportions of descriptive crime judgments ("is this a crime where you live") matching the participant's state-law code, by scenario.

Scenario	n	n correct	Accuracy	95% CI	Scenario type
1	81	62	.77	[.66, .85]	Abortion (state-variant)
2	81	63	.78	[.67, .86]	Abortion (state-variant)
3	80	66	.82	[.72, .90]	Abortion (state-variant)
4	80	63	.79	[.68, .87]	Abortion (state-variant)
5	81	81	1.00	[.95, 1.00]	State-invariant
6	81	81	1.00	[.95, 1.00]	State-invariant
7	81	77	.95	[.88, .99]	State-invariant
8	81	79	.97	[.91, 1.00]	State-invariant
9	81	57	.70	[.59, .80]	State-invariant
10	81	52	.64	[.53, .75]	Abortion (state-variant)
11	81	32	.40	[.29, .51]	Substance use (state-variant)
12	81	77	.95	[.88, .99]	State-invariant
13	81	78	.96	[.90, .99]	State-invariant
14	81	81	1.00	[.95, 1.00]	State-invariant
15	81	78	.96	[.90, .99]	State-invariant
16	81	61	.75	[.65, .84]	Abortion (state-variant)
17	81	80	.99	[.93, 1.00]	State-invariant
18	81	80	.99	[.93, 1.00]	State-invariant
19	81	80	.99	[.93, 1.00]	State-invariant

Scenario	n	n correct	Accuracy	95% CI	Scenario type
20	81	78	.96	[.90, .99]	State-invariant

Note. 95% CI = one-sample binomial interval. State-invariant = same code across all 51 jurisdictions; state-variant = codes differ by state.

Verdicts, Mental State and Legal Accuracy

This chapter reports the analyses of the narratives by verdict condition (RQ2, H2a, H2b, and H2c) and three exploratory analyses. These are the accuracy of participants' legal judgments, the three-way interaction of abortion attitudes, state law, and judgment type, and the comparison of the narratives with television plotlines and documented cases.

Narrative Features by Verdict Condition (RQ2)

A series of descriptive chi-square tests compared the frequency of each feature across the four verdict conditions, with the Benjamini–Hochberg correction applied across the testable features (RQ2; see Table P1.16). After correction, the four verdict conditions differed on 12 narrative features. These included legal terminology, $\chi^2(3, N = 311) = 28.98$, BH-adjusted p < .001. For causal structure, the association with verdict condition was Cramér's V = .29.

Table P1.16

Pilot 1 Associations Between Verdict Condition and Narrative Features (RQ2)

Feature	n	chi-square	df	Cramer's V	95% CI	p (BH)
Legal terminology	311	28.98	3	.29***	[.17, 1.00]	< .001
Causal connections	311	28.19	3	.29***	[.17, 1.00]	< .001
Mental health referenced	311	18.47	3	.22**	[.09, 1.00]	.007
Temporal sequence	311	17.51	3	.22**	[.08, 1.00]	.007
Existing children	311	17.09	3	.21**	[.07, 1.00]	.007
Defendant age specified	311	16.92	3	.21**	[.07, 1.00]	.007
Healthcare provider present	311	15.47	3	.20*	[.05, 1.00]	.012
Witness testimony	311	14.58	3	.19*	[.03, 1.00]	.016
Jury reasoning	311	14.10	3	.19*	[.00, 1.00]	.018

Note. n = number of narratives included in the test; Cramer's V = effect size (95% CI). p (BH) = p-value Benjamini-Hochberg-adjusted across the 65 testable Phase 1/2 features; the table lists the 10 features with the smallest adjusted p values (defendant age category gives the same test as defendant age specified and is not listed separately). Asterisks denote BH-adjusted significance: * p < .05. ** p < .01. *** p < .001.

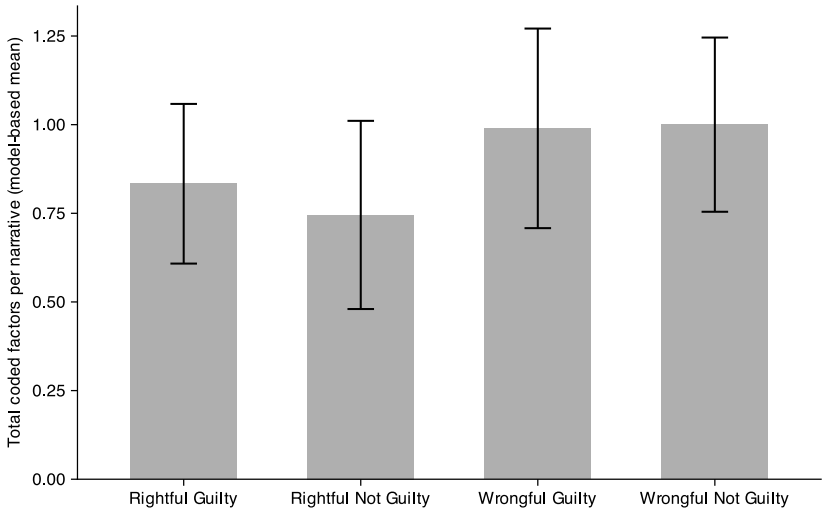

Coded Factors by Verdict Condition (H2a and H2b)

H2a predicted that narratives written toward a wrongful verdict would contain more coded mitigating and aggravating factors than narratives written toward a rightful verdict. There was

no significant difference in total coded factors per narrative across the four verdict conditions, $F(3, 76) = 0.88$, $MSe = 0.33$, $p = .456$, $\eta^2 = .034$. Contrary to H2a, narratives in the wrongful conditions ($M = 1.00$, $SD = 0.56$) did not contain significantly more coded factors than narratives in the rightful conditions ($M = 0.80$, $SD = 0.57$; see Figure P1.3).

Figure P1.3

Pilot 1 Coded Factors by Verdict Condition

Note. Estimated marginal mean of total coded factors per narrative by verdict condition, from the H2a one-way ANOVA. Error bars indicate 95% confidence intervals.

H2b predicted that the wrongful–rightful difference would be larger for mitigating than for aggravating factors. There was no significant interaction between verdict condition and factor type, $F(3, 76) = 0.59$, $MSe = 0.13$, $p = .622$, $\eta_p^2 = .023$. Contrary to H2b, the wrongful–rightful difference was not larger for mitigating factors. However, there was a significant main effect of factor type: narratives contained more mitigating factors ($M = 0.50$, $SD = 0.37$) than aggravating factors ($M = 0.39$, $SD = 0.39$; $F(1, 76) = 4.54$, $MSe = 0.13$, $p = .036$, $\eta_p^2 = .056$).

Mental State by Actual Culpability (H2c)

H2c rests on the coded mental-state category, so I report it as exploratory. H2c predicted that narratives in the culpable conditions would attribute purposeful or knowing mental states

more often than narratives in the non-culpable conditions. The relationship between actual culpability and coded mental state was not significant, $\chi^2(1, N = 279) = 0.32$, $p = .572$. Contrary to H2c, coded mental state did not differ by actual culpability. However, the mental-state code did not meet the preregistered reliability target (ICC = .67, registered $\kappa = .43$, target = .80; see Table P1.5), leaving this result inconclusive. The code was not reliable enough to tell whether participants matched the mental state to the verdict they wrote toward or to the facts of the case.

Legal Accuracy of the Crime Judgments

State-law coding. For the legal-accuracy sub-analysis, participants' descriptive judgments ("Is this a crime where you live?") were compared with the legal status of each scenario in their state of residence as of May 2026. Participant responses were matched based on accuracy (yes/no). However, given that the specifics of state laws regarding abortion remain in flux and convoluted, I did not interpret a mismatch as true ignorance of the underlying state-specific status. For example, many state abortion bans do not apply to pregnant people as a matter of black letter law, but they still can be, and have been, used to criminalize abortion (Weigel et al., 2020), so whether self-managed abortion is a crime in a given state is not a clear binary. The coding rules, sources, and confidence flags used in the preregistered sensitivity analysis appear in State-Law Coding for the Legal-Accuracy Sub-Analysis and Table P1.17.

State-Law Coding for the Legal-Accuracy Sub-Analysis

The legal-accuracy sub-analysis compared each participant's answer to the descriptive question ("Is this a crime where you live?") with the current legal status of each of the 20 scenarios in the participant's reported state. To do this I drew on several existing sources. These were the Center for Reproductive Rights' "After *Roe* Fell" map as of May 2026 (Center for Reproductive Rights, 2026), Pregnancy Justice's *After Pregnancy Loss* report (Pregnancy Justice, 2026), the NCSL's fetal-homicide compilation (National Conference of State Legislatures, 2018), and the appellate case law in Aspinwall (2023), Bach & Wasilczuk (2025), and Darlington et al. (2021). Table P1.17 provides the basic coding scheme.

Table P1.17

Per-Scenario Legal Coding for the Pilot 1 Legal-Accuracy Sub-Analysis

#	Experience	Crime in	Confidence
1	Online abortion pills (confirmed pregnancy)	13 Illegal states	Medium
2	Provider-prescribed abortion pills	13 Illegal states	Medium
3	Clinic surgical abortion	13 Illegal states	Medium

#	Experience	Crime in	Confidence
4	Abortion pills before pregnancy test	13 Illegal states	Low
5	Miscarriage	None	High
6	Stillbirth	None	High
7	Miscarriage management: pills, 12 weeks	None	High
8	Miscarriage management: D&C, 8 weeks	None	High
9	Home disposal of remains after miscarriage	None	Low
10	Home disposal of remains after abortion pills	13 Illegal states	Low
11	Substance use causing fetal death	AL, SC, OK	Medium
12	Accident causing fetal death	None	Medium
13	Ectopic pregnancy removed	None	High
14	Missed period	None	High
15	Emergency contraception	None	High
16	Unsuccessful herbal abortion attempt	13 Illegal states	Low
17	Searched online for abortion information	None	High
18	Told a friend about not wanting to be pregnant	None	High
19	Delayed prenatal care	None	Low
20	Did not seek care after pregnancy loss	None	Low

Note. Crime in = the jurisdictions in which the scenario was coded as a crime (1); it was coded 0 everywhere else. Confidence (high, medium, low) indicates how firmly the statutes and case law support each coding.

A few scenarios called for a judgment. The legal status of the inchoate-conduct scenarios is unclear, so I assigned them low confidence. The miscarriage-management scenarios and home disposal after a miscarriage are not defined as crimes in their own right. I therefore coded them under the general abuse-of-corpse or concealment statutes (Pregnancy Justice, 2026; Rinkunas, 2026). I assigned medium confidence to the substance-use scenario on the basis of appellate decisions in Alabama, South Carolina, and Oklahoma (Aspinwall, 2023). Most cases with known pregnancy outcomes in the documented sample involved live births, however, limiting their relevance to the fetal-death scenario (Bach & Wasilczuk, 2025). Confidence was also medium for the accident scenario and low for the omission-of-care scenarios. Most fetal-homicide statutes exempt the pregnant woman (National Conference of State Legislatures, 2018; Unborn Victims of Violence Act of 2004, 2004), and no statute makes delaying or failing to report care a crime on its own (Pregnancy Justice, 2026).

I report the legal-accuracy analysis as exploratory. Compared with the state-law coding, accuracy differed significantly from chance on 19 of the 20 scenarios. Accuracy on the 13 state-invariant scenarios ranged from .70 to 1.00 (*M* = .96) and was lower on average on the six abortion scenarios with between-state variance (.64 to .82, *M* = .76). The per-scenario accuracy tallies appear in Table P1.15.

Abortion Attitudes, State Law, and Judgment Type

I report this analysis as exploratory. When the state-law coding was added to the mixed-effects model of card-sort crime judgments, the three-way Attitudes × State Law × Judgment Type interaction was significant (OR = 0.28, 95% CI [0.13, 0.63], $z = -3.09$, $p = .002$; see Table P1.13). The pilot was not powered for the three-way interaction, so I report that estimate descriptively.

Comparisons With Television and Documented Cases

Table P1.18 compares the methods specified in the narratives with the procedures visually depicted in U.S. television plotlines (Herold & Sisson, 2019). The automated Section J code found no references to actual cases in the 311 narratives.

I used Pregnancy Justice (2023); the registered television source provided no comparable prosecution figures. For chemical endangerment, I used the criminal child neglect, abuse, or endangerment category (.84 of cases with known charges). I used .06 for fetal homicide and .01 for self-managed abortion. For improper disposal, I added two Pregnancy Justice categories together: tampering with remains or abuse of a corpse (.02) and failure to report a birth or death (.01), for .03. One case could carry charges in more than one category, however, so the categories can overlap.

The prompts, in contrast, were split evenly across the four crimes, at about .25 each. Compared with the prosecutions, then, the prompts gave more weight to fetal homicide, self-managed abortion, and improper disposal and less to chemical endangerment. Because the design fixed those shares, the narrative proportions cannot show how common participants believe each crime to be.

Table P1.18

Abortion Methods in Pilot 1 Narratives and on Television

Method	Pilot 1 narratives	U.S. television plotlines
Medication / pills	.27	.19
Herbs / substances	.27	.08
Physical / instrument	.42	.67
Other	.04	.06

Note. Narrative proportions are out of the narratives that specified a method in Section F; television proportions are out of the 36 visually depicted procedures. I counted the 24 surgical procedures as physical or instrument methods and divided the five procedures that were neither surgical nor medication between herbs or substances and other. The comparison was registered; I ran no inferential test.

About this document

This part includes the full analyses for Pilot Study 2. Chapter 5 of the dissertation reports the hypotheses and main results. Here I report the analytic framework and hypotheses, the full results with their tables and figures, and the supplementary, exploratory, and robustness analyses.

Pilot Study 2 Design and Materials

Pilot Study 2 used a 3 (scenario: self-managed abortion, non-criminal miscarriage, criminal miscarriage; within participants) × 2 (search outcome: expected or unexpected incriminating evidence; between participants) × 2 (timing: before or after the search outcome; within participants) mixed design. I assigned participants to one search-outcome condition, which they retained across all three scenarios, and presented the affidavits in one of six counterbalanced orders. Participants gave the core judgments before and after each outcome. Table P2.1 and Figure P2.1 show the assignment and timing; Table P2.2 links all nine scenario documents.

Table P2.1

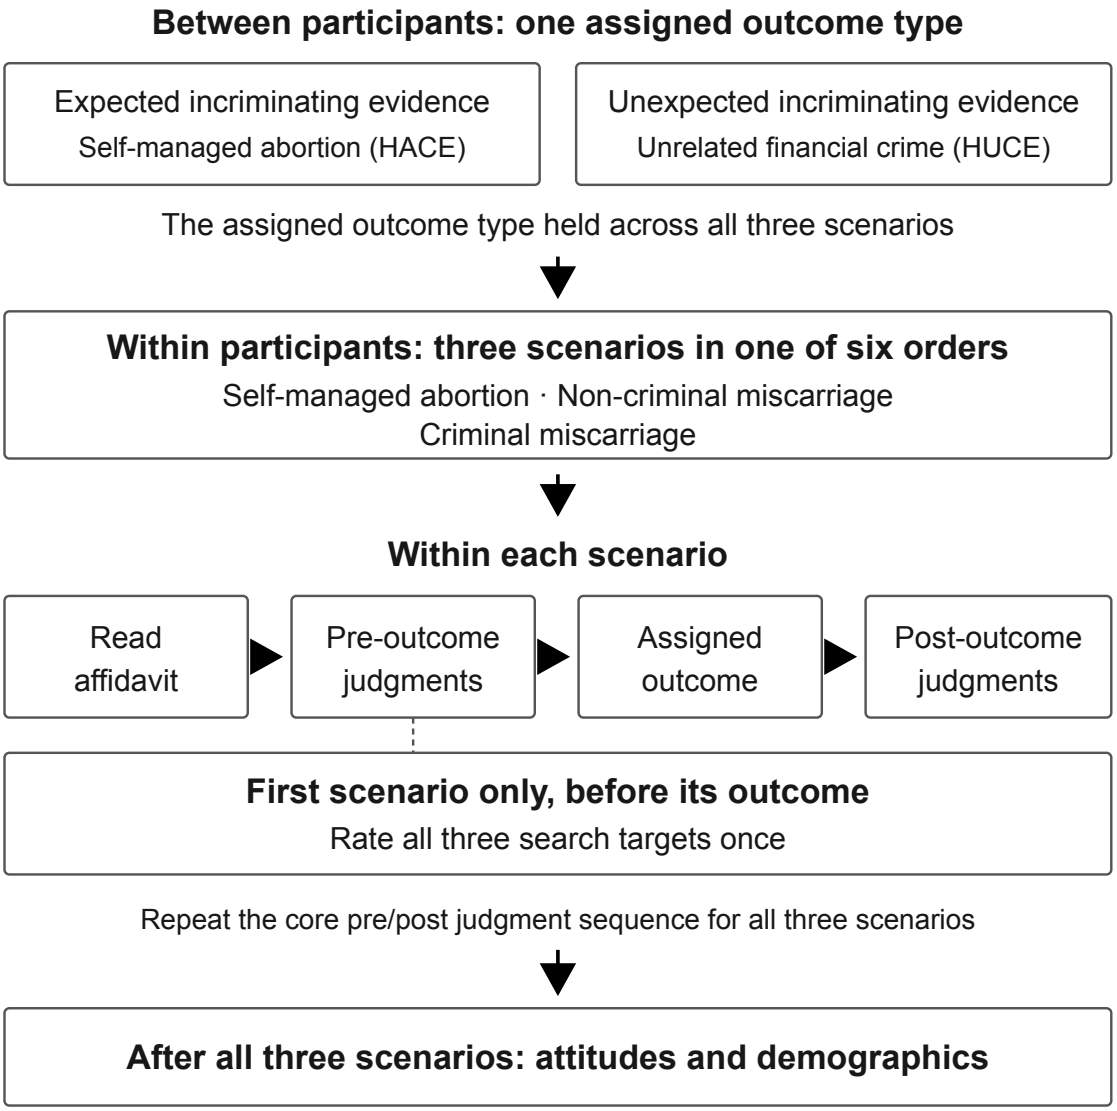

Pilot Study 2 Design and Measurement Timing

Component or condition	Design / what the participant received	Materials
Study design	Three scenarios within participants × two search-outcome types between participants × before/after timing within participants. Each participant read all three affidavits in one of six orders.	Figure P2.1
Search-outcome assignment	Expected incriminating evidence of a self-managed abortion (HACE) or unexpected incriminating evidence of an unrelated financial crime (HUCE), held constant across all three scenarios.	Table P2.2
Judgment timing	Core judgments before and after each search outcome. Evidence believability was pre-outcome only; the suspect's mental-state and moral-culpability measures were post-outcome only.	Full survey questions and stimulus wording
Search targets	The three search targets were rated once, during the first affidavit and before the search outcome.	Search-target questions

Note. Before/after timing applied to the core judgments, not every measure. The search-target block preceded outcome information in the first scenario only.

Figure P2.1

Pilot Study 2 Assignment and Within-Participant Sequence

Note. The sequence repeated for all three scenarios. The search-target block appeared once, before the outcome in the first scenario. The pre/post boxes identify the core judgments; the full materials specify measures administered at only one timing.

Scenario Documents

Table P2.2

Pilot Study 2 Scenarios and Search-Outcome Materials

Scenario	Affidavit before search	Expected incriminating evidence (HACE)	Unexpected incriminating evidence (HUCE)
Self-managed abortion (SMA)	SMA affidavit	SMA expected-evidence report	SMA unexpected-evidence report
Non-criminal miscarriage (NCM)	NCM affidavit	NCM expected-evidence report	NCM unexpected-evidence report
Criminal miscarriage (CM)	CM affidavit	CM expected-evidence report	CM unexpected-evidence report

Note. All participants read all three affidavits. Only the assigned outcome column applied to each participant, and that assignment held across the three scenarios. Participants gave the core judgments before and after each outcome.

The full materials and measures reproduce the survey questions and stimulus wording. The study materials hub also links the documents and preserves the local image previews; the registered materials PDF provides the registered wording.

Pilot Study 2 Materials and Measures

The stimulus variations and study-specific survey questions are reproduced below. The stimulus materials and registered Pilot Study 2 materials and measures are also available.

Stimulus Wording

Table P2.3

Pilot 2 search outcome wording that differed between the HACE and HUCE conditions

Element	HACE condition	HUCE condition
Message list heading	Text messages between M. [suspect] and A. Donen	Text messages from device extraction
Other participant	+1 (555) 781-2345 (Donen)	+1 (555) 643-1108
First message	“I found a place online that ships them”	“I found a site online that sells the numbers”
Second message	“I can’t wait to get this thing out of my body”	“got three working cards if you want to run charges tonight”
Search term	“where to buy abortion pills online”	“where to buy stolen credit card numbers”

A. Attention Checks

1. To show you are reading each question carefully, please choose ‘Neither Agree nor Disagree.’
2. We want to make sure your responses are thoughtful. Please choose ‘Strongly Agree’ for this item.
3. Please read all instructions carefully. For this question, select ‘Disagree’ as your answer.

B. Subjective Probability of Guilt

Probability (0–100%) · 0–100 slider · Single item.

Item text (identical at both timings): “Based on the evidence available at the time the warrant was sought, what is the probability that the suspect committed the crime the detective suspects her of committing?”

Response: 0–100 slider, labeled *Probability (0–100%)*; the selected value displays with a percent sign.

Post-search debias preamble (precedes the item at the post-search timing): "Now that you have seen the results of the search, please re-rate the affidavit using the same scale, but think back to the time when the detective decided to seek the warrant and answer as if you did not know what the search ultimately revealed."

C.0. Gestational-Age Estimate (Post-Search, Block End; Once per Search Scenario) (Crawford et al., 2022)

Item (single choice, request response): "Based only on what you read, about how far along do you think the pregnancy was when the loss occurred?"

1. Early in the pregnancy (first trimester, roughly 1–12 weeks)
2. Around the middle (early second trimester, roughly 13–20 weeks)
3. Later in the pregnancy (late second trimester or beyond, roughly 21+ weeks)
4. Unsure / can't tell from the affidavit

C. Outcome Likelihood Estimates (Evelo & Greene, 2013; Fischhoff, 1975)

0% — 100% per outcome · Four items, fixed order, rated independently; ratings need not sum to 100%.

Pre-search instructions (foresight framing): "You are the judge who has been asked to authorize this search. Based only on the affidavit you just read and what the detective knew when seeking the warrant, please rate the likelihood of each of the following outcomes of the requested search by writing a probability value from 0% to 100% next to each outcome below. There are many possible outcomes; please rate each outcome independently."

Post-search instructions (hindsight framing with debias instruction): "Think back to the time when the detective asked you to authorize the search, before it was carried out. Putting yourself back at that moment and deciding based only on what was known then, as if you did not know what the search ultimately revealed, please rate the likelihood of each of the following outcomes of the requested search by writing a probability value from 0% to 100% next to each outcome below. There are many possible outcomes; please rate each outcome independently."

Four items, fixed order in every condition:

1. The search reveals evidence that the suspect illegally obtained an abortion to end her own pregnancy. ____%
2. The search reveals evidence that the suspect improperly disposed of the fetal remains or concealed the loss following a miscarriage or stillbirth. ____%
3. The search reveals evidence that the suspect committed a financial crime, such as stolen credit cards and associated records. ____%
4. The search reveals nothing illegal or incriminating. ____%

D. Foreseeability Impressions Items Index (Blank et al., 2008)

Strongly disagree				***Strongly agree***
1	2	3	4	5

Item 2 reverse-scored; four items averaged into the composite, plus a single general-foreseeability item.

Instructions (both timings): "Please indicate how strongly you agree or disagree with each of the following statements as a description of the scenario you read about."

Pre-search (future tense):

1. The detective knows, at the time he seeks the warrant, what the search will reveal.
2. It is difficult for the detective to predict what the search will reveal when he decides to seek the warrant. *(reverse-scored)*
3. The detective has a clear and vivid idea of what the search will reveal at the time he seeks the warrant.
4. Overall, from the detective's perspective, the outcome of the search is foreseeable.
5. Overall, from the detective's perspective, it is foreseeable that the search will uncover evidence of the offense described in the affidavit.

Post-search (past tense):

1. The detective would have known all along what the search would reveal at the time he sought the warrant.
2. It was difficult for the detective to predict what the search would reveal when he decided to seek the warrant. *(reverse-scored)*

3. The detective had a clear and vivid idea of what the search would reveal at the time he sought the warrant.
4. Overall, from the detective's perspective, the outcome of the search was foreseeable.
5. Overall, from the detective's perspective, it was foreseeable that the search would uncover evidence of the offense described in the affidavit.

E. Quality of the Detective's Decision (Blank et al., 2015)

Strongly disagree						***Strongly agree***
1	2	3	4	5	6	7

Five items averaged into a composite.

The post-search instruction adds a re-rating lead-in to the pre-search instruction; the five items are tensed by timing, **present tense pre-search** (the foresight block) and **past tense post-search**, parallel to the foreseeability scale.

Instructions (pre-search): "Think back to the time when the detective decided to seek the warrant and rate the quality of his decision."

Instructions (post-search): "Now that you have seen the results of the search, please rate the quality of the detective's decision again. Think back to the time when the detective decided to seek the warrant and rate the quality of his decision."

Pre-search (present tense):

1. The process leading to the detective's decision to seek the warrant is clear and transparent.
2. The detective's decision is fair and unbiased.
3. Any reasonable detective in this position would make the same decision.
4. The decision is made responsibly, taking all relevant information into account.
5. Overall, it is a good decision to seek the warrant.

Post-search (past tense):

1. The process leading to the detective's decision to seek the warrant was clear and transparent.
2. The detective's decision was fair and unbiased.
3. Any reasonable detective in this position would have made the same decision.
4. The decision was made responsibly, taking all relevant information into account.

5. Overall, it was a good decision to seek the warrant.

F. Severity of Consequences

Not at all serious						***Extremely serious***
1	2	3	4	5	6	7

Single item.

Item text (both timings): "How serious are the consequences of what happened in this case?"

Response: 7-point scale (1 = *not at all serious* to 7 = *extremely serious*).

F.2. Seriousness of the Revealed Crime (Post-Search Only) (Sood, 2015)

Not at all serious						***Extremely serious***
1	2	3	4	5	6	7

Single item.

Item text (post-search only): "How serious is the crime that the search uncovered?"

Response: 7-point scale (1 = *not at all serious* to 7 = *extremely serious*).

G. Ratings of the Search Scenario

Two 9-point subscales (believability; relevance) · 10 narrative evidence items, the same list at every administration · Each subscale is administered as a 10-statement matrix with drop-down responses, the instruction as the matrix stem on the same page, and statement order randomized per participant.

The relevance dimension is adapted from the Casper et al. (1989) and Robbennolt & Sobus (1997) evidence-reinterpretation paradigm. The believability dimension is taken verbatim from Marshall (2022).

G.a Believability Ratings

Instructions (matrix stem, pre-search only): "Please rate how believable you think it is that each of the following items from the situation leading up to the search would actually occur in a real life situation:"

Response: 9-point scale (1 = *not at all believable* to 9 = *extremely believable*), one rating per evidence item.

G.b Relevance Ratings (Casper et al., 1989)

Pre-search instructions (future tense, foresight variant; matrix stem): "Next, we would like you to rate how relevant you think each of the following items from the situation leading up to the search would be to what would actually be found as a result of the search of the suspect's phone:"

Post-search instructions (past tense, hindsight variant; matrix stem): "Next, we would like you to rate how relevant you think each of the following items from the situation leading up to the search were to what was actually found as a result of the search of the suspect's phone:"

Response: 9-point scale (1 = *not at all relevant* to 9 = *extremely relevant*), one rating per evidence item.

Evidence Items (per Search Scenario)

SMA vignette (Mary Hansen)

1. That an anonymous coworker observed that the suspect had been pregnant and was no longer pregnant.
2. That the suspect appeared to be dating around and did not have a long-term romantic partner.
3. That the suspect was enrolled as a community college student.
4. That the suspect had not told her parents, workplace, or friends about her pregnancy.
5. That the suspect had sought reproductive care through a telehealth service rather than a local hospital or clinic.
6. That the suspect said she was alone when she lost her pregnancy at home.
7. That the suspect put the remains in a bag and buried it outside Millfield.
8. That the suspect went to a hair appointment soon after losing her pregnancy.
9. That the suspect experienced cramping and heavy bleeding but did not seek medical care immediately.
10. That the suspect was 19 years old and lived with a roommate.

NCM vignette (Mary Johnston)

1. That an anonymous coworker observed that the suspect was no longer pregnant.
2. That the suspect had been trying to conceive and was openly excited about her pregnancy.
3. That the suspect had held a stable job for several years.
4. That the suspect had told her husband, her doctor, and her workplace about her pregnancy.
5. That the suspect had been receiving prenatal care from an obstetrician.
6. That the suspect said she was alone when she lost her pregnancy at home.
7. That the suspect retrieved the remains from the toilet and buried them in her backyard.
8. That the suspect took time off work to recover after losing her pregnancy.
9. That the suspect experienced cramping and heavy bleeding and went to the hospital, where she was treated for hemorrhage and retained tissue.
10. That the suspect was 32 years old and lived with her husband.

CM vignette (Mary Larson)

1. That an anonymous coworker reported the suspect had hidden her pregnancy and lost it at home.
2. That the suspect had been in an on-and-off relationship with her boyfriend and was not married.
3. That the suspect had recently started a retail job.
4. That the suspect had not told her family, her roommate, or her boyfriend about her pregnancy.
5. That the suspect had taken only a home pregnancy test and had not seen any medical provider during her pregnancy.
6. That the suspect said she was alone when she lost her pregnancy at home.
7. That the suspect tried to flush the remains, and when the toilet backed up, put them in a bag in the trash.
8. That the suspect kept a hair appointment and worked her shift soon after losing her pregnancy.
9. That the suspect experienced cramping and heavy bleeding but did not seek medical care immediately.
10. That the suspect was 25 years old and lived with a roommate.

H. Suspect Mens Rea (Model Penal Code Culpability Hierarchy; Post-Search Only) (Kneer & Skoczeń, 2023)

Strongly disagree						***Strongly agree***
1	2	3	4	5	6	7

Four items, rated separately (no composite).

Instructions (post-search only): "Please indicate how strongly you agree or disagree with each of the following statements about the suspect's state of mind."

1. It was the suspect's purposeful objective to end the pregnancy. *(purposefully)*
2. The suspect was practically certain that the pregnancy would end. *(knowingly)*
3. The suspect was aware of a substantial risk that the pregnancy would end. *(recklessly)*
4. The suspect should have been aware of a substantial risk that the pregnancy would end. *(negligently)*

I. Suspect's Moral Culpability (Post-Search Only) (Alicke, 2000)

Three single-item 7-point measures, rated separately (no composite); anchors as shown per item.

Blame item (1 = *not at all blameworthy* to 7 = *extremely blameworthy*): "To what extent is the suspect blameworthy for what happened?"

Responsibility item (1 = *not at all responsible* to 7 = *completely responsible*): "How responsible is the suspect for what happened?"

Punishment item (1 = *no punishment at all* to 7 = *very severe punishment*): "How much punishment does the suspect deserve for what happened?"

Multi-Model Blame Items (Alicke et al., 2008; Cushman et al., 2008; Malle et al., 2014)

Five single-item 7-point measures, rated separately; anchors as shown per item.

Causality item (1 = *not at all a cause* to 7 = *very strong cause*): "To what extent did the suspect's actions cause the pregnancy loss?" Verbatim from Alicke et al. (2008) (Study 1), anchor adapted from 11-point to 7-point.

Reasons item (1 = *not at all justified* to 7 = *completely justified*): "Did the suspect have justified reasons for her conduct during the pregnancy?" We wrote this item, grounded in the Guglielmo & Malle (2017) Table 1 reasons template.

Preventability item (1 = *definitely not* to 7 = *definitely yes*): "Could the suspect have prevented the pregnancy loss?" Single combined unintentional-branch item. We wrote this item, grounded in the Guglielmo & Malle (2017) Table 1 preventability template.

Character item (1 = *very unfavorable* to 7 = *very favorable*): "Given what you know about the suspect from these case materials, do you have a generally favorable or unfavorable impression of her?" Verbatim from Alicke et al. (2008) (Study 3), anchor adapted from 11-point to 7-point.

Wrongness item (1 = *not at all* to 4 = *somewhat* to 7 = *very much*): "Was the suspect's conduct during the pregnancy morally wrong?" Verbatim from Cushman et al. (2008) (Experiment 1).

J. Detective's Moral Culpability (Post-Search Only)

Three items · 0–10 scales · anchors as shown per item.

1. To what extent is the detective blameworthy for his decision to seek the warrant? (0 = *not at all blameworthy*; 10 = *extremely blameworthy*)
2. How severe a consequence should the detective face for his decision to seek the warrant? (0 = *no consequence at all*; 10 = *very severe consequence*)
3. How right or wrong was the detective's decision to seek the warrant? (0 = *not wrong at all*; 10 = *very wrong*)

K. Search-Target Endorsement (Pre-Search, Administered Once)

Target 1: Reverse keyword warrant (lowest invasiveness). "A court order directing a technology company to identify any person who recently searched for specified pregnancy-related or abortion-related terms on the company's search engine." (Kerr, 2025)

Target 2: Provider text-message content warrant (moderate invasiveness). "A warrant served on the suspect's cellular-service provider compelling disclosure of the content of the suspect's text messages." (Stored Communications Act § 2703(d)) (Conti-Cook & Bertash, 2021; Dellinger & Pell, 2024)

Target 3: Physical home search (highest invasiveness). "A warrant authorizing law enforcement officers to physically search the suspect's home." (Baucum et al., 2018)

1. **Binary endorsement.** "Would you approve of a law enforcement officer conducting this search?" (Yes / No)
2. **Certainty threshold.** "What percentage certain would you have to be that the suspect committed the offense described in the affidavit before approving this search?" (0–100 slider, labeled *Certainty required (0–100%)*)
3. **Probability of evidence given guilt.** "If the suspect had indeed committed the offense described in the affidavit, what is the probability that this search would uncover evidence of it?" (0–100 slider, labeled *Probability (0–100%)*) (Baucum et al., 2018).

L. Manipulation Checks

L.a Per-Scenario Comprehension Check

Prompt (in every vignette block): "Please indicate which of the following statements are true about the case you just read. Check all that apply."

SMA vignette (Mary Hansen)

1. The suspect identified in the affidavit was named Mary Hansen.
2. The suspect told the detective she had visited a single telemedicine appointment with an unnamed provider.
3. The suspect called emergency services immediately after the pregnancy loss.

NCM vignette (Mary Johnston)

1. The suspect identified in the affidavit was named Mary Johnston.
2. The suspect was married and had been actively trying to conceive.
3. The suspect did not disclose the pregnancy to her workplace.

CM vignette (Mary Larson)

1. The suspect identified in the affidavit was named Mary Larson.

2. The suspect tried to flush the remains but the toilet backed up, then placed the remains in a bag and put it in the trash.
3. The suspect disclosed the pregnancy to her boyfriend.

In every block, items 1 and 2 are true and item 3 is false; the three were presented in random order.

L.b Manipulation Check

Item: "What did the search reveal at the end of each affidavit you read?"

- Evidence consistent with the suspect's intentional termination of the pregnancy, concealment of the loss, or improper disposal of remains *(correct in the HACE condition)*
- Evidence of unrelated credit-card fraud *(correct in the HUCE condition)*
- I cannot recall what the search revealed

Options were presented in random order. A participant passed the check by selecting the option that matched their assigned outcome.

M–R. Individual-Difference Measures

Pilot 2, Study 1, and Study 2 administered the same six individual-difference scales (the Modified Abortion Attitude Scale, Support for Punishment of Women for Miscarriage, the Ambivalent Sexism Inventory short form, the religiosity scale, the political-orientation items, and the Outcome Preference Measure), provided in the registered Pilot Study 2 materials and measures.

S. Demographics

The demographic items administered in Pilot 2 are provided in the registered Pilot Study 2 materials and measures.

Analytic Framework and Hypotheses

Analytic Framework.

I conducted the analyses in R (R Core Team, 2026), using Bayesian multilevel models in brms (Bürkner, 2017, 2018) to account for the repeated ratings within participants. Non-criminal miscarriage was the reference scenario. I computed planned contrasts with marginaleffects (Arel-Bundock et al., 2024) and summarized indirect effects from the posterior draws (Falk et al., 2023; Makowski et al., 2019; Miočević et al., 2018; Vuorre & Bolger, 2018). I assessed the effects using their 95% credible intervals (Kruschke & Liddell, 2018).

The preregistration allowed frequentist mixed factorial ANOVAs of the continuous outcomes. The analysis plan also included a GEE check of search-target endorsement. I evaluated the registered hypotheses with the Bayesian decision rules. This supplement reports the Bayesian results.

The multilevel models take the following form. Y is a continuous outcome measured on occasion t (i.e., before or after the outcome, or the vignette) within participant j. The kind of incriminating evidence found, $\mathrm{Outcome}_j$, varies between participants:

$$
\begin{aligned}
\text{Level 1:} \quad & Y_{tj} = \pi_{0j} + \pi_{1j} W_{tj} + e_{tj}, \quad e_{tj} \sim \mathcal{N}(0, \sigma^2) \\
\text{Level 2:} \quad & \pi_{0j} = \gamma_{00} + \gamma_{01} \,\mathrm{Outcome}_j + u_{0j} \\
& \pi_{1j} = \gamma_{10} + \gamma_{11} \,\mathrm{Outcome}_j + u_{1j} \\
& (u_{0j}, u_{1j})^\top \sim \mathcal{N}(\mathbf{0}, \mathbf{T}).
\end{aligned}
$$

Here W_{tj} is the within-participant factor (i.e., before or after the outcome, or the vignette). The within-participant change is represented by γ_{10}, with γ_{11} representing how that change depends on the kind of evidence found. Participant intercepts and slopes have covariance matrix $\mathbf{T}$. For binary search-target endorsement, I retained the Level-2 structure and modeled $\mathrm{logit}\left(\Pr(Y_{tj} = 1)\right)$ in place of Y_{tj}, without a Level-1 residual term.

I used mean-zero Normal priors for the regression coefficients, with widths matched to the outcome scales to provide weak regularization. The log-odds coefficients of the binary-choice models had a similarly weak prior (Bürkner, 2018; Gelman et al., 2008; Gelman et al., 2014; Hox et al., 2018; Sorensen et al., 2016). I used an LKJ(2) prior for correlations among participant random effects and retained the scale-aware Student-*t* defaults in brms for intercepts, random-effect standard deviations, and residual standard deviations (Bürkner, 2017, 2018).

For the H5a sensitivity check, I refit the model with half and twice the coefficient-prior widths (Depaoli et al., 2020; Hox et al., 2018). Table P2.4 gives the prior for each parameter class.

Table P2.4

Pilot 2 prior specifications for the Bayesian regression models, by parameter class.

Parameter class	Prior	Basis
Coefficients, 0–100 outcome family	Normal(0, 20)	E-max/2 on the response scale
Coefficients, 1–5 foreseeability and its change scores	Normal(0, 1)	Quarter of the response range
Coefficients, 0–10 detective-directed items	Normal(0, 2.5)	Quarter of the response range
Coefficients, 1–7 and 1–9 rating families and z-scored traits	Normal(0, 1.5)	Quarter of the response range
Coefficients, rescaled 0–10 mediator DVs (per-10-point metric)	Normal(0, 2)	E-max 4 on the rescaled metric
Coefficients, binary-choice models (log-odds)	Normal(0, 1.5)	Weakly informative on the logit scale
Random-effect correlations	LKJ(2)	Mild shrinkage toward independence
Intercepts, random-effect SDs, residual SDs	brms scale-aware Student-t defaults	Auto-scaled weakly informative defaults

Note. Values are taken directly from the study's prior-construction code. E-max/2 = a prior standard deviation of roughly half the largest plausible condition effect on the outcome's own scale. For bounded rating scales it is a quarter of the response range.

For H5a, E5.1, E5.2 and E6.4, the first-stage mediator equations used one participant mean per person; the later equations retained the scenario ratings.

I fit the brms models with four chains per data set (Bürkner, 2017, 2018). The default chain length was 4,000 iterations, including 1,000 warmup, with longer chains when needed for convergence. The primary H5a and matched-item models used five completed data sets and 32,000 iterations per chain, including 8,000 warmup. I required $\hat{R} < 1.01$, bulk and tail effective sample sizes > 400, and no divergent transitions (Vehtari et al., 2021).

Hypotheses.

Table P2.5 pairs the confirmatory hypotheses with their Chapter 5 labels.[2]

[2]The study's OSF page contains the preregistration and supplementary document, including the complete hypothesis wording, assigned models, and decision rules.

Table P2.5

Pilot 2 confirmatory hypotheses, grouped under the hypothesis labels in Chapter 5.

Hypothesis Number	*Hypothesis Title*	*Hypothesis*
H1a. The pre-search likelihood of the four possible search outcomes		
RH6.1	vignette differences in the pre-search likelihood of the candidate search outcomes [RQ1]	I predicted that the three vignettes would differ in the pre-search likelihood participants assigned to the four candidate search outcomes.
H2a. Subjective probability of guilt		
RH1.1	Pre–post shift in probable-cause strength [RQ2]	I predicted that, within each participant, the rated strength of probable cause would be higher after the search outcome was revealed than before, even though they were told to set the outcome aside.
RH2.1	HACE versus HUCE hindsight shift [RQ2]	I predicted that this hindsight shift in probable cause would be larger when the recovered evidence matched the warrant's pregnancy theory (an expected outcome) than when it did not (an unexpected outcome).
H2b. Perceived foreseeability of the revealed outcome		
RH1.3	Pre–post increase in foreseeability [RQ2]	I predicted that participants would judge the outcome more foreseeable after it was revealed than before.
H2c. Estimated likelihood of the revealed outcome		
RH1.2	Outcome-knowledge allocation shift [RQ2]	I predicted that each participant's allocation of likelihood across the possible outcomes would shift toward whatever the search actually recovered.
RH2.2	Vignette-moderated allocation shift [RQ2]	I predicted that the shift toward pregnancy-specific likelihood would depend on the vignette in the pattern Causal Model Theory predicts, largest where the case gave the outcome the best causal fit.

Hypothesis Number	*Hypothesis Title*	*Hypothesis*
H2d. Rated likelihood on the financial-crime item		
RH2.3	Financial-crime filler-item shift [RQ2]	I predicted that the financial-crime filler item would rise after the search specifically when the search recovered the unrelated financial-crime evidence (the unexpected outcome), as a specificity check on the allocation shift.
H3a. The matched-outcome probability judgment and the rated relevance of the evidence items		
RH3.1	[RQ3]	I expected the allocation shift to be mediated by a shift in how relevant participants rated each kind of evidence after the outcome was revealed.
RH3.2	[RQ3]	I predicted that a latent factor of evidence interpretation, measured by the ten evidence items, would carry the effect of the search outcome to the probability estimates. I first tested whether the items measured the same thing before and after the outcome was revealed.
RH1.4	Pre–post increase in evidence relevance [RQ2]	I predicted that participants would rate the evidence already in hand as more relevant after the outcome was revealed than before.
H4a. Evaluations of the detective's decision quality		
RH4.1	Pre–post decision-quality shift [RQ4]	I predicted that each participant's rating of the quality of the detective's decision to seek the warrant would be more favorable after the outcome was revealed than before.

Hypothesis Number	*Hypothesis Title*	*Hypothesis*
RH4.2	Expected-vs-unexpected outcome and decision quality [RQ4]	I predicted that this shift in decision quality would be larger when the recovered evidence matched the warrant's theory (an expected outcome) than when it did not (an unexpected outcome).
H5a. Blame		
RH5.1	Expected-vs-unexpected outcome and suspect blame [RQ5]	I predicted that blame of the suspect would be higher when the recovered evidence matched the warrant's pregnancy theory (an expected outcome) than when it did not (an unexpected outcome).
RH5.4	Serial pathway to suspect blame [RQ5]	I predicted that the outcome's effect on blame would run through a chain, the recovered outcome raising the perceived probability of a pregnancy-specific offense, then the attributed negligence, then blame.
H5b. Responsibility		
RH5.5	Expected-vs-unexpected outcome and responsibility [RQ5]	I predicted that suspect responsibility, treated as distinct from blame, would also differ between the expected and unexpected outcomes.
H5c. Punishment deserved		
RH5.2	Expected-vs-unexpected outcome and punishment severity [RQ5]	I predicted that endorsed punishment would likewise be higher under the expected outcome than the unexpected one.
H5d. Attributed mens rea		
RH5.3	Expected-vs-unexpected outcome across the mens rea ladder [RQ5]	I predicted that the expected-versus-unexpected difference in the attributed mental state would be largest at the lower rungs of the mental-state ladder, recklessness and negligence.

Hypothesis Number	*Hypothesis Title*	*Hypothesis*
RH5.6	Mens rea culpability ordering [RQ5]	I predicted that, within each outcome condition, the attributed mental states would fall in the expected order, purposeful above knowing above reckless above negligent.

Note. The statements paraphrase the registration, which gives the exact wording and decision rules.

Full Analyses

Baseline Expectations

Participants rated pregnancy-evidence likelihood before learning what the search found. I compared their later ratings with their own pre-search ratings.

Pregnancy-Evidence Likelihood and Guilt

I examined changes after expected incriminating evidence in ratings of illegally obtained abortion (Item 1) and improper disposal or concealment of the loss (Item 2). Table P2.12 reports these changes in each of the three vignettes (the six RH2.2 cells, marked †) among all 24 cells of E2.3, and Table P2.6 reports the RH2.3 contrasts on the financial-crime item (Item 3). In the self-managed abortion case, participants increased the Item 1 rating (b = 16.74, 95% credible interval [11.83, 21.49], $p(b > 0) > .999$). The increase was greater for Item 1 than Item 2 (b = 18.65, 95% credible interval [12.08, 25.67], $p(b > 0) > .999$), consistent with the outcome specificity described by Yopchick & Kim (2012).

Table P2.6

Pilot 2 RQ1 contrasts on the financial-crime likelihood item (RH2.3).

Quantity	Estimate	95% HDI	Pr(effect > 0)
RH2.3 timing x outcome on the Financial item, VIGNETTE-AVERAGED (registered criterion)	22.750*	[18.890, 26.580]	> .999
RH2.3 sub-condition: HUCE pre->post increase on the Financial item, vignette-averaged (credibly positive required)	22.080*	[19.420, 24.890]	> .999
RH2.3 sub-condition: HACE pre->post change on the Financial item, vignette-averaged (near zero required)	−0.670	[−3.480, 2.090]	.321
descriptive: same contrast @ SMA	21.710*	[15.130, 27.900]	> .999
descriptive: same contrast @ NCM	21.590*	[15.890, 27.470]	> .999
descriptive: same contrast @ CM	24.980*	[18.650, 31.480]	> .999

Note. All rows concern the financial-crime likelihood item (Item 3). The first row is the registered RH2.3 criterion: the before-to-after change after unexpected incriminating evidence (HUCE) minus the change after expected incriminating evidence (HACE), averaged over the three vignettes. The next two rows are its registered sub-conditions: the vignette-averaged before-to-after change after HUCE (required to be credibly positive) and after HACE (required to be near zero). The last three rows give the first row's contrast within each vignette and are descriptive. The six RH2.2 before-to-after changes in Items 1 and 2 are the cells marked † in Table P2.12. * 95% HDI excludes zero.

Subjective probability of guilt. I also compared participants' guilt-probability ratings before and after the search outcome (Table P2.7). The table includes the main effect on foreseeability, and Figure P2.2 connects the mean guilt-probability ratings before and after the outcome for each vignette and outcome condition.

Table P2.7

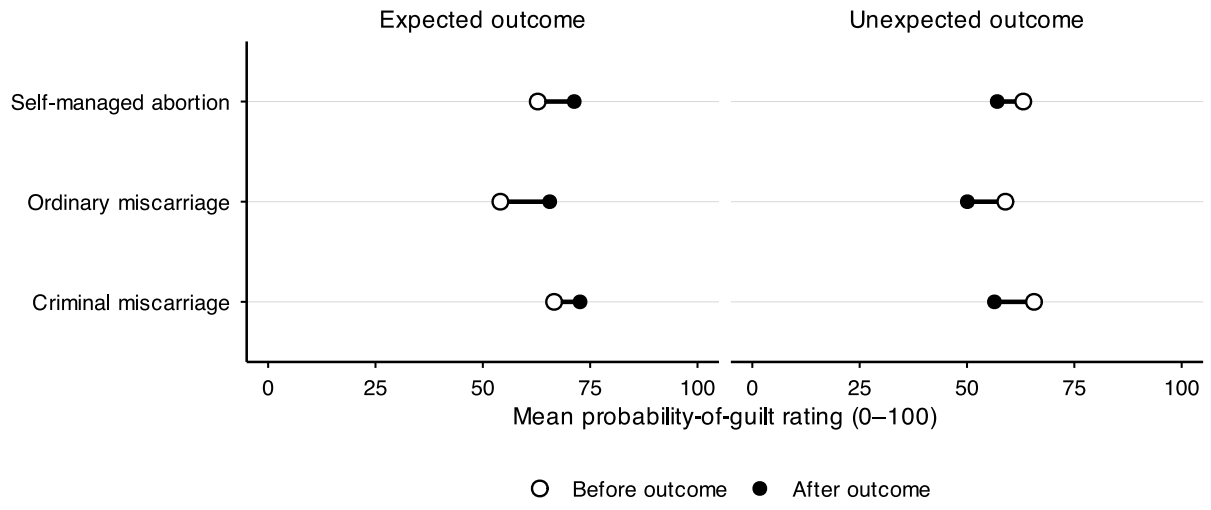

Pilot 2 RQ1 before/after subjective-probability-of-guilt rating and foreseeability contrasts.

Quantity	Estimate	95% HDI	Pr(effect > 0)
Rating, before/after — RH1.1 rating Timing main effect (post - pre), vignette-averaged	0.308	[−1.738, 2.238]	.618
Rating, before/after — RH2.1 rating timing x outcome (expected outcome > unexpected outcome), vignette-averaged	16.488*	[12.597, 20.467]	> .999
Foreseeability — RH1.3 foreseeability Timing main effect (post - pre, pooled; no committed direction)	−0.138*	[−0.202, −0.076]	< .001

Note. Rating rows report within-participant before-to-after shifts; the foreseeability row reports the within-participant before-to-after main effect on the foreseeability composite. * 95% CrI excludes zero.

Figure P2.2

Pilot 2 before-to-after shift in the subjective probability-of-guilt rating (0–100): each vignette's mean rating before the outcome connected to its mean rating after, faceted by the revealed outcome (expected vs. unexpected).

Evidence reinterpretation (RQ3). The result for evidence reinterpretation uses the measurement model selected in Table P2.11. Table P2.16 reports the same indirect effect with the observed composite (RH3.1) and the indirect effects for each vignette (E3.1); they did not determine which measurement model was selected.

Pregnancy-Specific Likelihood and Foreseeability Across the Cases.

Following Nestler & Egloff (2009), I adapted the distinction between hindsight components to the cases in this study (see Chapter 4). If foreseeability and pregnancy-specific likelihood reflect different mechanisms, the largest increases should occur in different cases, producing opposite orderings across cases rather than opposite changes within a case. The gain in likelihood should be largest in the criminal miscarriage case, where the outcome is easiest to reconcile with the facts. The gain in foreseeability should be largest in the self-managed abortion case, where the outcome is least surprising. The test is therefore the difference between the self-managed abortion and criminal miscarriage cases. I predicted that this difference would be positive for foreseeability and negative for the likelihood. For the self-managed abortion vs. criminal miscarriage contrast, the pregnancy-specific likelihood shift was 0.03 and the foreseeability shift was −0.03, and the posterior probability that the two shifts carry opposite signs was .175.

A related test asked whether the change after expected evidence was larger for pregnancy-specific foreseeability than for general foreseeability. Table P2.17 reports the change in each measure and the difference between them.

Evaluations of the Detective's Decision.

Table P2.8 reports two registered decision-quality contrasts (RH4.1 and RH4.2) and three exploratory quantities. In the exploratory analyses, I expected ratings of the quality of the detective's decision to fall from before to after the outcome under both expected and unexpected evidence (i.e., a before-to-after main effect). I did not expect the two kinds of evidence to differ on the composite. The exploratory analyses split the change into a hindsight route (i.e., through evidence reinterpretation) and an outcome-bias route (i.e., through the preference for false-positive or false-negative errors). Table P2.8 reports the contrasts and both routes.

Table P2.8

Pilot 2 RQ2 decision-quality contrasts (registered) and indirect-path decomposition (exploratory).

Contrast / route	Estimate	95% CrI	P(b > 0)
Decision-quality contrasts (Registered)			
RH4.1 decision-quality Timing main effect (post - pre; registered direction positive), vignette-averaged	0.17*	[0.09, 0.25]	> .999
RH4.2 timing x outcome (expected outcome > unexpected outcome), vignette-averaged	0.27*	[0.12, 0.42]	> .999
Indirect decomposition (Exploratory)			
hindsight route (a_s * b_s)	0.14*	[0.09, 0.19]	> .999
direct outcome-bias route (a_sigma * b_sigma)	0.04*	[0.003, 0.07]	.988
index of moderated mediation (a_sigma * mod)	−0.001	[−0.03, 0.02]	.430

Note. * 95% CrI excludes zero.

Two more tables report related results. Table P2.18 reports E4.1 with specific foreseeability in place of the subjective probability of guilt. Table P2.19 reports the E4.3 indirect effects for each vignette and two relative indices. For RH4.1, I expected participants to evaluate the detective's decision more favorably after learning the search outcome. The registered before-to-after coefficient for RH4.1 is its row in Table P2.8; I used the change in subjective probability of guilt as E4.1′s primary mediator. The negative exploratory expectation above was separate from RH4.1.

Judgments of the Detective.

These analyses were exploratory. E6.1 tested the effects of the search outcome on the detective's blameworthiness, the consequences the detective deserved, and the wrongness of the decision. I used E6.4 to test whether expected versus unexpected incriminating evidence affected consequence severity through outcome-specific foreseeability and then the detective's blameworthiness. The modeled serial indirect effect was not credibly negative, and the conditional direct effects did not credibly differ from zero or from each other (Table P2.22).

Model of Suspect Blame Through Likelihood and Negligence.

The modeled serial indirect effect on suspect blame through pregnancy-specific likelihood and then negligence was not credible (the second part of H5a; Table P2.9). The fitted model appears in Figure P2.3, and the remaining likelihood–punishment path (Miočević et al., 2018) appears in Table P2.10.

I also tested pregnancy-specific likelihood, foreseeability, attributed negligence, and attributed recklessness as parallel mediators in the exploratory four-mediator model (E5.2). Expected versus unexpected incriminating evidence had positive modeled indirect effects on blame through negligence, recklessness, and likelihood; the modeled indirect effect through foreseeability was not credible (Table P2.9).

Table P2.9

Pilot 2 Primary and Exploratory Indirect and Direct Effects on Suspect Blame

Quantity	Estimate	95% HDI	Pr(effect > 0)
Primary model — RH5.4 serial indirect (a1 * d * b2)	0.213	[−0.043, 0.496]	.960
Primary model — Single-mediator indirect through p_preg (a1 * b1)	0.382*	[0.106, 0.693]	.997
Primary model — Direct path c' (expected vs. unexpected outcome)	−0.063	[−0.752, 0.645]	.425
Exploratory four-mediator — Pregnancy-specific likelihood	0.339*	[0.194, 0.504]	> .999
Exploratory four-mediator — Foreseeability	0.001	[−0.104, 0.104]	.508
Exploratory four-mediator — MPC negligence	0.610*	[0.376, 0.868]	> .999
Exploratory four-mediator — MPC recklessness	0.441*	[0.141, 0.746]	.998

Note. Unstandardized posterior medians. HDI = highest density interval; Pr(effect > 0) = posterior probability of a positive effect. The serial indirect tests H5a; the likelihood-only and four-mediator indirects are exploratory. *The 95% HDI excludes zero.

Table P2.10

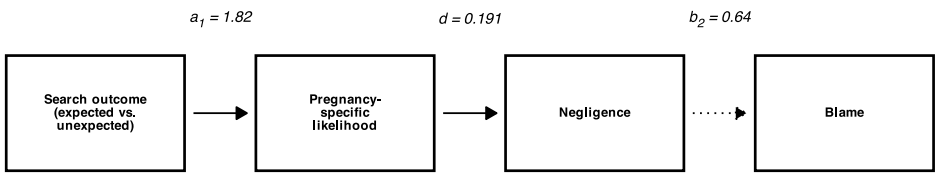

Pilot 2 E5.3 residual direct effect (c′) of between-person pregnancy-specific likelihood on punishment after adjustment for the serial chain (blame-versus-punishment diagnostic).

Contrast	c′	95% CrI	P(c′ > 0)	P(c′ < 0)
direct pregnancy-specific likelihood (between) -> punishment	0.17*	[0.11, 0.22]	> .999	< .001

Note. A retained positive c′ on punishment is the Cushman (2008) punishment pattern. * 95% CrI excludes zero.

Figure P2.3

Pilot 2 Fitted Serial Mediation Model of Suspect Blame (H5a).

Note. Coefficients are unstandardized posterior medians; pregnancy-specific likelihood is divided by 10. Solid arrows mark paths whose 95% HDI excludes zero; dotted arrows mark paths whose HDI includes zero. The diagram shows the between-person chain; the remaining model paths are omitted.

I compared the likelihood–negligence and foreseeability–negligence routes from outcome information to blame (E5.1). Neither modeled serial indirect effect was credible; Table P2.15 reports both effects, their difference, and the direct effect. Adding relevance before likelihood gave the longer relevance–likelihood–negligence route to blame in E5.7, for which I obtained a bias-corrected bootstrap interval (Table P2.20).

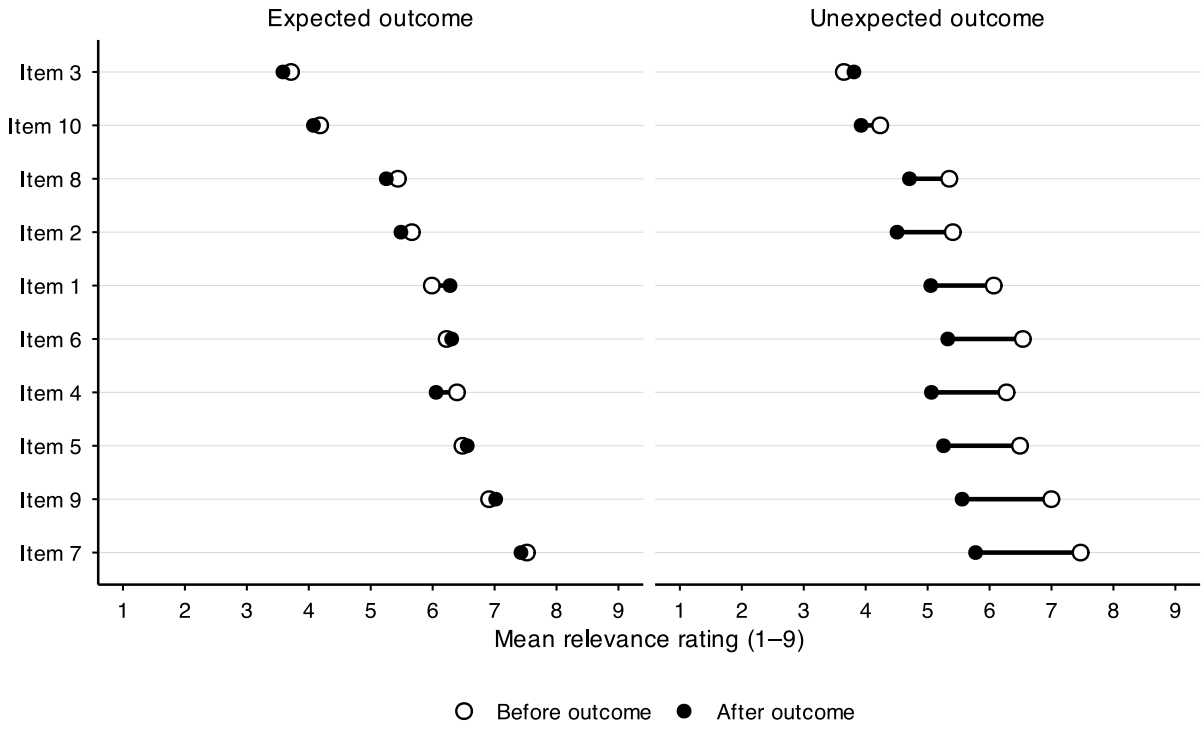

Attitudes as moderators and mediators (exploratory). I compared pregnancy-specific likelihood and foreseeability between expected and unexpected evidence at 1 *SD* below and above the abortion-attitude mean (E5.4). E5.6 estimated the sexism subscales' indirect associations with punishment through support for punishment and abortion attitudes (Table P2.21).

Evidence Reinterpretation

I describe the change in relevance using the composite (the descriptive companion row of Table P2.25) and individual items within each vignette in Table P2.26. The item comparisons have unadjusted *p* values. The registered RH1.4 analysis separately tests the interaction between timing and item consistency (see Evidence Reinterpretation (RQ3)).

Figure P2.4

Evidence Relevance Before and After the Search Outcome

Note. Mean item ratings (1–9) for expected and unexpected evidence.

Search Endorsement

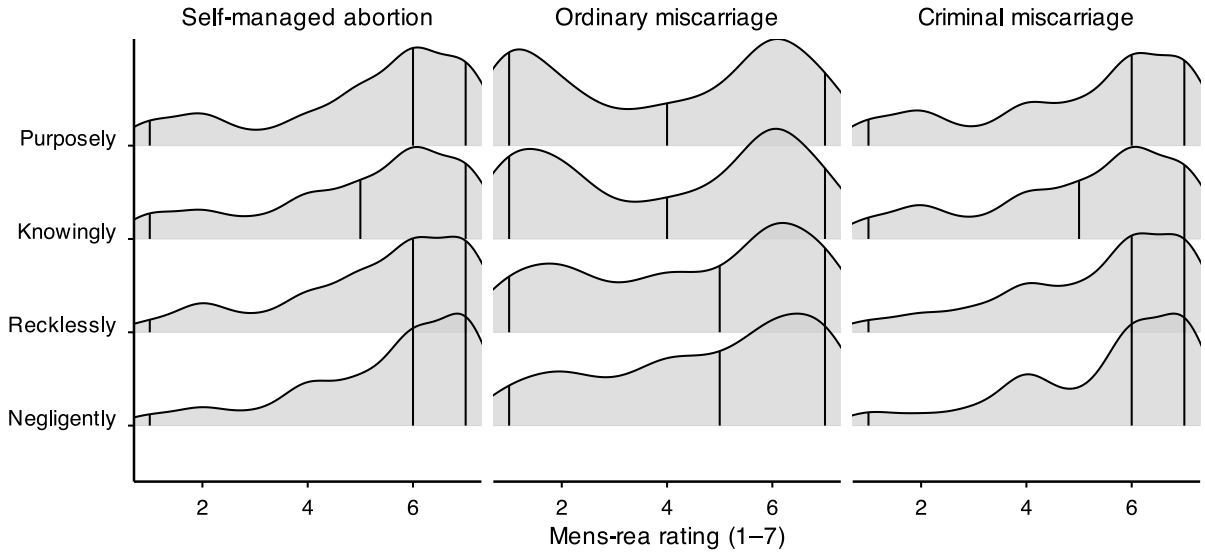

Participants' certainty requirements and the endorsement thresholds are different quantities. The thresholds concern the subjective probability of guilt at which the model predicts a .50 probability of approving a search. Observed endorsement appears in Table P2.23. Table P2.24 gives the population-level E7.7 thresholds and the proportion of posterior draws with a threshold within the guilt-probability scale. I described target ordering without testing it.

Mens-Rea Attributions by Search Scenario.

I plotted post-search ratings of the four Model Penal Code culpability levels by scenario. Table P2.28 reports the RH5.6 comparisons between adjacent levels.

Figure P2.5

Post-Search Mens Rea Ratings by Scenario

Note. Ratings ranged from 1 to 7. Lines mark the 2.5th, 50th, and 97.5th percentiles.

Robustness Diagnostics.

Table P2.27 describes the probability of the complete ordering.

RH5.6 requires the 95% HDIs for purposely minus knowingly and recklessly minus negligently to lie above zero in both outcome conditions. I also report knowingly minus recklessly, although the rule does not require it. The result appears as H5d in Mens Rea Hierarchy (H5d). For RH5.4, Table P2.29 compares the sensitivity estimates with the primary estimate, indicating agreement in sign and whether each interval excludes zero.

Registered Analyses Reported in the Supplement

Of the three registered predictions reported here, H2a concerned whether guilt-probability ratings changed more after expected than unexpected evidence, particularly in the two criminal-conduct scenarios. I expected the narrative-prototype ordering of the scenarios to hold for pregnancy-specific likelihood changes after expected evidence (H2c), and the Model Penal Code culpability hierarchy to hold for mental-state ratings within each evidence condition (H5d). None of the three predictions met all registered support criteria.

For the observed means and standard deviations, I averaged each participant's ratings over the three scenarios. Model estimates are posterior medians with 95% HDIs; probability of direction (pd) is the proportion of draws with the median's sign. Differences in likelihood and guilt probability retain the 0–100 units.

Content Match: Subjective Probability of Guilt (H2a)

I predicted that, after expected incriminating evidence, participants would inflate the subjective probability of the suspect's guilt relative to their own pre-search ratings, more so than after unexpected incriminating evidence, and more so in the self-managed abortion and criminal miscarriage scenarios than in the non-criminal miscarriage scenario (H2a).

Consistent with the first part of H2a, the change in the subjective probability of the suspect's guilt from before to after the search outcome was larger after expected than after unexpected incriminating evidence (the RH2.1 row of Table P2.7). After expected incriminating evidence, ratings rose from before the search outcome (M = 61.16, SD = 22.26) to after it (M = 69.83, SD = 22.81), an estimated change of 8.55, 95% HDI [5.70, 11.36]; after unexpected incriminating evidence, they fell (before: M = 62.55, SD = 24.10; after: M = 54.50, SD = 25.52), an estimated change of −7.94, 95% HDI [−10.73, −5.20]. Contrary to the second part of H2a, the increase after expected incriminating evidence was not reliably larger in the self-managed abortion and criminal miscarriage scenarios than in the non-criminal miscarriage scenario (posterior probability .103, below the registered threshold). Descriptively, it was largest in the non-criminal miscarriage scenario (10.90) and smaller in the self-managed abortion (8.60) and criminal miscarriage (6.16) scenarios.

Registered verdict. Not supported by all registered criteria.

Inevitability (H2c)

I further predicted that the change in the pregnancy-specific likelihood would follow the narrative-prototype pattern (criminal miscarriage > self-managed abortion > non-criminal miscarriage; H2c).

H2c predicted the largest increase in disposal or concealment likelihood in the criminal miscarriage scenario after expected incriminating evidence. However, its change did not credibly exceed zero (−0.81, 95% HDI [−5.75, 3.92], pd = 62.9%), nor did the changes in the other two scenarios, and the probability of the predicted ordering was below .001. The non-criminal miscarriage comparison also ran contrary to the prediction: the mean of the two pregnancy items increased (95% HDI [8.43, 15.16]).

Registered verdict. Not supported by all registered criteria. I checked convergence for all parameters and for the registered coefficients separately, using the criteria in Analytic Framework and Hypotheses. The all-parameter check failed. Neither diagnostic reading supported H2c; a failed convergence criterion precludes registered support.

Mens Rea Hierarchy (H5d)

I predicted the Model Penal Code culpability ordering in participants' mental-state ratings within each evidence condition (H5d).

H5d was not supported in either evidence condition. Of the adjacent-level contrasts the registered named-step rule requires (purposely minus knowingly and recklessly minus negligently, after each kind of evidence), only purposely minus knowingly after expected incriminating evidence had a 95% HDI above zero; Table P2.28 gives all six contrasts.

Registered verdict. Not supported by all registered criteria.

Selected Evidence-Reinterpretation Model (RQ3)

I used the **EFA-indicated latent branch** selected by the measurement comparisons, which retained **scalar invariance**. The results below are primary; Table P2.16 retains the observed-composite estimates as secondary analyses.

Table P2.11

Pilot 2 RH3.1 selected measurement-model branch: indirect effects and residual direct effect on matched-outcome likelihood change.

Quantity	Estimate	95% HDI	Pr(effect > 0)
Indirect effect, factor 1 (a*b)	2.254	[−10.557, 19.949]	.607
Indirect effect, factor 2 (a*b)	−1.235	[−22.570, 15.177]	.454
Indirect effect, factor 3 (a*b)	−0.091	[−1.322, 1.139]	.356
Total latent indirect effect (sum of a*b; registered read)	1.140	[−4.839, 5.562]	.704
Direct path c-prime (outcome -> delta-likelihood)	−13.903*	[−20.665, −6.713]	< .001

Note. For a multifactor branch, the total latent indirect is the sum of the factor-specific products. Intervals are 95% HDIs; probabilities are Pr(effect > 0). * 95% HDI excludes zero.

Likelihood Changes and Parallel-Then-Serial Pathways

I examined the changes in likelihood after the search outcome in E2.3, including termination likelihood after unexpected evidence. E2.4 compared the expected-evidence change in termination minus concealment likelihood between self-managed abortion (i.e., SMA) and criminal miscarriage (i.e., CM); non-criminal miscarriage (i.e., NCM) remained descriptive. In E5.1, I estimated the two parallel-then-serial indirect effects on blame, their difference, and the remaining direct effect. I report these analyses descriptively, without separate support thresholds.

Table P2.12

Pilot 2 E2.3: all 24 pre-to-post likelihood changes, by search outcome, vignette and likelihood item, in percentage points.

Quantity	Estimate	95% HDI	Pr(effect > 0)
Expected outcome · SMA			
Pregnancy termination†	16.74*	[11.83, 21.49]	> .999
Concealed miscarriage†	−1.92	[−6.76, 2.96]	.216
Financial crime	0.46	[−4.22, 5.10]	.579
Nothing incriminating	−2.83	[−7.66, 1.97]	.125
Expected outcome · NCM			
Pregnancy termination†	23.21*	[18.49, 27.97]	> .999
Concealed miscarriage†	0.28	[−4.57, 4.85]	.547
Financial crime	0.80	[−3.52, 5.23]	.642
Nothing incriminating	−7.36*	[−12.12, −2.68]	.001
Expected outcome · CM			
Pregnancy termination†	13.43*	[8.53, 18.19]	> .999
Concealed miscarriage†	−0.81	[−5.75, 3.92]	.371
Financial crime	−3.28	[−7.94, 1.49]	.087
Nothing incriminating	−6.24*	[−11.14, −1.47]	.006
Unexpected outcome · SMA			
Pregnancy termination	−5.23*	[−9.88, −0.45]	.014
Concealed miscarriage	−15.33*	[−20.02, −10.62]	< .001

Quantity	Estimate	95% HDI	Pr(effect > 0)
Financial crime	22.17*	[17.60, 26.78]	> .999
Nothing incriminating	−3.39	[−8.04, 1.40]	.080
Unexpected outcome · NCM			
Pregnancy termination	−2.45	[−7.07, 2.24]	.150
Concealed miscarriage	−12.95*	[−17.62, −8.33]	< .001
Financial crime	22.40*	[18.09, 26.79]	> .999
Nothing incriminating	−7.64*	[−12.39, −3.11]	< .001
Unexpected outcome · CM			
Pregnancy termination	−6.71*	[−11.42, −2.04]	.003
Concealed miscarriage	−14.41*	[−19.09, −9.63]	< .001
Financial crime	21.70*	[17.05, 26.24]	> .999
Nothing incriminating	−3.43	[−8.15, 1.31]	.079

Note. † One of the six RH2.2 before-to-after changes after expected incriminating evidence (HACE): Items 1 and 2 (pregnancy termination and concealed miscarriage) in each of the three vignettes. * 95% HDI excludes zero.

Table P2.13

Pilot 2 E2.3 reverse-hindsight readout: the SMA-minus-CM difference in the unexpected-outcome change in termination likelihood, in percentage points.

Quantity	Estimate	95% HDI	Pr(effect > 0)
Difference in termination changes under HUCE: SMA - CM	1.47	[−5.31, 7.99]	.667

Note. The change in each vignette (SMA, CM and NCM) is the Pregnancy termination row of its Unexpected outcome block in Table P2.12; negative changes denote decreases, and NCM has no directional prediction. * 95% HDI excludes zero.

Table P2.14

Pilot 2 E2.4: expected-outcome termination-minus-concealment changes by vignette and the registered final SMA-minus-CM contrast, in percentage points.

Quantity	Estimate	95% HDI	Pr(effect > 0)
Termination - concealment change under HACE: SMA	18.65*	[12.08, 25.67]	> .999
Termination - concealment change under HACE: NCM	22.93*	[16.33, 29.58]	> .999
Termination - concealment change under HACE: CM	14.23*	[7.29, 21.01]	> .999
E2.4 (termination - concealment change under HACE): SMA - CM	4.46	[−5.23, 14.16]	.815

Note. NCM is descriptive. * 95% HDI excludes zero.

Table P2.15

Pilot 2 E5.1: complete serial indirect effects through pregnancy-specific likelihood and through foreseeability, each continuing through negligence to blame; their difference; and the residual direct outcome effect on blame.

Quantity	Estimate	95% HDI	Pr(effect > 0)
Pregnancy-specific likelihood → negligence → blame	0.117	[−0.023, 0.316]	.961
Foreseeability → negligence → blame	0.137	[−0.027, 0.341]	.962
Pregnancy-specific likelihood indirect - foreseeability indirect	−0.010	[−0.204, 0.157]	.413
Direct outcome effect on suspect blame (HACE - HUCE)	−0.077	[−0.705, 0.585]	.403

Note. No direction is predicted for the difference or direct effect. * 95% HDI excludes zero.

Exploratory Analyses

This chapter reports the exploratory analyses that support the primary Pilot 2 tests. They include the analyses based on causal model theory, the attitude analyses, and the analyses of later judgments.

Table P2.16

Pilot 2 observed-composite reinterpretation results: the RH3.1 companion indirect, E3.1 conditional indirects by vignette, and three relative indices.

Indirect route	Indirect	95% HDI	P(indirect > 0)
RH3.1 observed-composite companion indirect	−0.315	[−1.606, 0.969]	.310
E3.1 conditional indirect @ SMA	−0.321	[−1.718, 1.025]	.312
E3.1 conditional indirect @ NCM	−0.278	[−1.514, 0.907]	.312
E3.1 conditional indirect @ CM	−0.317	[−1.652, 1.076]	.312
E3.1 relative index of moderated mediation (CM - NCM)	−0.011	[−0.443, 0.331]	.425
E3.1 relative index of moderated mediation (SMA - NCM)	−0.012	[−0.449, 0.325]	.420
E3.1 relative index of moderated mediation (CM - SMA)	0.001	[−0.355, 0.350]	.508

Note. * 95% HDI excludes zero.

Table P2.17

Pilot 2 E2.1: pre-to-post Timing coefficients for the specific-foreseeability composite and general-foreseeability item, and their difference, on the native 1–5 scale.

Quantity	Estimate	95% HDI	Pr(effect > 0)
Specific-foreseeability composite	−0.112*	[−0.217, −0.010]	.018
General-foreseeability item	−0.099	[−0.217, 0.023]	.055
Timing effect: specific - general	−0.013	[−0.166, 0.143]	.433

Note. Signed posterior probabilities are Pr(effect > 0). * 95% HDI excludes zero.

Table P2.18

Pilot 2 E4.1 alternative foreseeability operationalization: indirect routes through changes in specific foreseeability and rated severity, and the residual direct effect on decision quality.

Quantity	Estimate	95% HDI	Pr(effect > 0)
hindsight route (a_f * b_f; via Delta specific-foreseeability)	0.088*	[0.050, 0.129]	> .999
direct outcome-bias route (a_sigma * b_sigma; via Delta severity)	0.038*	[0.004, 0.074]	.988
residual direct path c’	0.149*	[0.018, 0.270]	.989

Note. The registered primary operationalization uses the subjective-probability slider. * 95% HDI excludes zero.

Table P2.19

Pilot 2 E4.3: vignette-averaged specific-foreseeability indirect; relative indices for SMA – NCM and CM – NCM; three vignette-specific indirects; general-foreseeability indirect; and residual direct path.

Effect	Estimate	95% HDI	pd
E4.3 specific-foreseeability indirect (vignette-averaged a_spec * b_spec; expected > 0)	0.077*	[0.026, 0.131]	.999
E4.3 relative index of moderated mediation, SMA - NCM ((a_spec,SMA - a_spec,NCM) * b_spec)	0.040*	[0.005, 0.083]	.997
E4.3 relative index of moderated mediation, CM - NCM ((a_spec,CM - a_spec,NCM) * b_spec)	0.041*	[0.005, 0.084]	.997
E4.3 conditional specific indirect, NCM (reference)	0.047*	[0.011, 0.092]	.999
E4.3 conditional specific indirect, SMA	0.090*	[0.029, 0.156]	.999
E4.3 conditional specific indirect, CM	0.091*	[0.030, 0.158]	.999
E4.3 general-pole indirect (vignette-averaged a_gen * b_gen; expected to include 0)	0.100*	[0.051, 0.154]	1.000
E4.3 residual direct c’ (Blank et al., 2015 independence; expected to exclude 0)	0.114	[−0.030, 0.257]	.940

Note. Estimate = posterior median. Indirect effects are products of posterior draws of the constituent paths. The lagged-covariate form and the two relative indices are an added analysis, not registered. Intervals are 95% HDIs; pd is the posterior probability of direction. * 95% HDI excludes zero.

Table P2.20

Pilot 2 four-stage serial indirect (the kind of incriminating evidence found → evidence relevance → pregnancy-specific likelihood → negligence → suspect blame), with a bias-corrected nonparametric bootstrap 95% confidence interval.

Quantity	Indirect	95% BC CI
Four-stage serial indirect (relevance first stage)	0.0178*	[0.0062, 0.0407]

Note. The registered exploratory read-out is a confidence interval excluding zero in the positive direction. * 95% CI excludes zero.

Table P2.21

Pilot 2 RQ6 exploratory results.

Term / contrast	Estimate	95% HDI	P(b > 0)
Attitude moderation			
pregnancy-specific likelihood · Outcome x AAS interaction	−1.545	[−6.420, 3.462]	.269
pregnancy-specific likelihood · expected-vs-unexpected outcome at AAS +1 SD	17.483*	[10.417, 24.423]	> .999
pregnancy-specific likelihood · expected-vs-unexpected outcome at AAS −1 SD	20.595*	[13.480, 27.441]	> .999
foreseeability · Outcome x AAS interaction	−0.062	[−0.230, 0.110]	.239
foreseeability · expected-vs-unexpected outcome at AAS +1 SD	0.441*	[0.195, 0.678]	> .999
foreseeability · expected-vs-unexpected outcome at AAS −1 SD	0.565*	[0.325, 0.805]	> .999
Hostile/benevolent-sexism parallel mediation			
HS through Chalmers	0.164*	[0.092, 0.243]	> .999
HS through Sloan	0.183*	[0.113, 0.258]	> .999
BS through Chalmers	0.088*	[0.043, 0.141]	> .999
BS through Sloan	0.151*	[0.090, 0.219]	> .999

Note. E5.4 rows report Outcome × abortion-attitude interactions and expected-minus-unexpected outcome contrasts at attitude ±1 SD for pregnancy-specific likelihood and foreseeability. E5.6 rows report the hostile- and benevolent-sexism indirect paths to punishment through punishment support and abortion attitudes. * 95% HDI excludes zero.

Table P2.22

Pilot 2 Exploratory Serial Indirect and Conditional Direct Effects on Consequence Severity (E6.4)

Quantity	Estimate	95% HDI	Pr(effect > 0)
serial indirect a1*d21*b2 (expected vs. unexpected outcome)	−0.3828	[−0.8530, 0.0003]	.019
conditional direct effect c-prime at false-negative-worse	−0.2175	[−0.8408, 0.4234]	.248
conditional direct effect c-prime at false-positive-worse	0.0086	[−0.5886, 0.6126]	.511
conditional direct-effect contrast (false-positive-worse minus false-negative-worse)	0.2258	[−0.5715, 1.0162]	.710

Note. Unstandardized posterior medians for expected minus unexpected incriminating evidence. The direct-effect contrast is false-positive-worse minus false-negative-worse. HDI = highest density interval; Pr(effect > 0) = posterior probability of a positive effect. *The 95% HDI excludes zero.

Search-Target Endorsement (RQ7)

These analyses are exploratory. They concern whether participants would authorize each search, which is a different judgment from the probable cause ruling.

Table P2.23

Pilot 2 RQ7 descriptive search-target endorsement proportions by search outcome, vignette, and search target.

Evidence found	Case	n	% endorsed
Home			
Expected outcome	Criminal miscarriage	50	60.0%
Expected outcome	Ordinary miscarriage	53	54.7%
Expected outcome	Self-managed abortion	48	58.3%
Unexpected outcome	Criminal miscarriage	55	76.4%
Unexpected outcome	Ordinary miscarriage	48	58.3%
Unexpected outcome	Self-managed abortion	55	70.9%
Keyword			
Expected outcome	Criminal miscarriage	50	54.0%
Expected outcome	Ordinary miscarriage	53	41.5%
Expected outcome	Self-managed abortion	48	43.8%
Unexpected outcome	Criminal miscarriage	55	60.0%
Unexpected outcome	Ordinary miscarriage	48	43.8%
Unexpected outcome	Self-managed abortion	55	52.7%
Text message			
Expected outcome	Criminal miscarriage	50	68.0%
Expected outcome	Ordinary miscarriage	53	47.2%
Expected outcome	Self-managed abortion	48	64.6%
Unexpected outcome	Criminal miscarriage	55	72.7%
Unexpected outcome	Ordinary miscarriage	48	56.2%
Unexpected outcome	Self-managed abortion	55	76.4%

Table P2.24

Pilot 2 derived 50%-endorsement decision threshold by search target (exploratory).

Search target	Derived threshold (median)	95% HDI	Draws defined
Reverse keyword warrant	0.75	[0.60, 0.91]	100%
Provider text message	0.47	[0.32, 0.63]	100%
Physical residence	0.53	[0.38, 0.68]	100%

Note. The subjective probability of guilt (0–1) at which the endorsement model predicts a 0.5 probability of authorizing the search, per target, population-level: posterior median, 95% HDI, and the share of posterior draws with a defined in-range crossover. Descriptive; benchmarked against the Baucum et al. (2018) ascending-invasiveness ordering (reverse keyword < provider text < physical residence), not the numeric thresholds. A dash marks a target whose crossover is undefined in range for most draws.

Evidence Reinterpretation (RQ3)

RH1.4 was supported on the respecified item-level model (Table P2.25). The interaction of timing, outcome, and key consistency was 0.77, 95% HDI [0.52, 1.02], Pr(effect > 0) > .999, BF_{10} > 1000. The 95% HDI meets the registered rule that it lie above zero. The model met the registered convergence criteria.

I respecified the model because the registered model nests item consistency within outcome. The respecified model codes each item, for every participant, by whether it would be consistent with the expected outcome. After inspecting the raw means, I chose to compare the same items across the randomly assigned outcomes. I made that choice before fitting the revised model. That timing makes the test less severe (see item 9.1 of the Pilot 2 deviations record, included in this supplement, https://doi.org/10.5281/zenodo.23424192).

The registered model tests the interaction of timing and item consistency, with NCM as the reference vignette (the registered row of Table P2.25). Its 95% HDI meets the registered criterion of a positive interval. Its registered convergence criteria were met (worst within-imputation R-hat = 1.002, lowest effective sample size = 2250, total divergent transitions = 0). In the eight-item sensitivity analysis without items 3 and 10 (added analysis, not registered), the result of the registered model holds (0.68 [0.49, 0.87]). The result of the respecified model does not hold (0.23 [−0.08, 0.54]). Without those two items, its key contrast rests on the NCM vignette alone. The change in the observed composite is descriptive. The exploratory tests for each item below keep the registered grouping by vignette.

The registered model had a divergent transition. To address it, I refit the model on the fourth imputed data set with `adapt_delta` = .99 (previously .95; added analysis, not registered) and kept the other four fits. The model, priors, data, random seeds, initial values, and iteration counts did not change.

Table P2.25

Pilot 2 RH1.4: the respecified item-level model as reported (deviation 9.1), the registered model, and the descriptive companion.

Quantity	Estimate	95% HDI	Pr(effect > 0)	BF_{10}
RH1.4 respecified: timing × outcome × key consistency	0.771*	[0.521, 1.016]	> .999	> 1000
RH1.4 timing x item-consistency slope (consistent - inconsistent)	0.474*	[0.312, 0.638]	> .999	> 1000

Quantity	Estimate	95% HDI	Pr(effect > 0)	BF_{10}
RH1.4 descriptive companion: composite relevance Timing main effect (post - pre)	−0.639*	[−0.823, −0.450]	< .001	—

Note. The respecified row is the timing × outcome × key-consistency coefficient, the difference between the expected and unexpected outcomes in the pre-to-post change of key-consistent relative to key-inconsistent items. The registered row is the consistent-minus-inconsistent difference in pre-to-post item relevance change from the registered model with NCM as the reference vignette. Ten-item composite change was descriptive. Estimates are posterior medians; HDI = highest density interval; Pr(effect > 0) = posterior probability of a positive effect. BF_{10} = Savage–Dickey Bayes factor for the two item-level models, reported as a bound when zero lay outside the posterior draw range. RH1.4 required a 95% HDI above zero. *95% HDI excludes zero.

Table P2.26

Item-Level Changes in Evidence Relevance by Vignette

Vignette	Item	Rank-biserial	95% CI	p
Within-participant shift (signed-rank)				
SMA	Item 1	−0.221	[−0.340, −0.096]	.009*
SMA	Item 2	−0.288	[−0.401, −0.166]	< .001*
SMA	Item 3	−0.100	[−0.225, 0.029]	.270

CM	Item 10	0.061	[−0.068, 0.188]	.335

Note. Within each vignette, Wilcoxon signed-rank tests compared each item's pre- and post-search ratings within participants (matched-pairs rank-biserial effect sizes). Mann–Whitney tests compared each item's change between outcome conditions (rank-biserial effect sizes). *p* values were unadjusted, with α = .05. * $p < .05$.

Robustness Checks

This chapter reports the checks on the RH5.6 ordering and on the H5a model. For H5a, I checked the serial indirect effect using the scenario-matched pregnancy item and alternative exclusions, coefficient priors, and scenario-order adjustment.

Table P2.27

Posterior Probabilities of Mens Rea Ordering (RH5.6)

Search outcome	Pr(full ordering)	Pr(at least two ordered steps)
Expected outcome	< .001	.357
Unexpected outcome	< .001	< .001

Note. Full ordering = purposely > knowingly > recklessly > negligently. Joint probabilities were descriptive; registered decisions used the named contrasts in Table P2.28.

Table P2.28

Adjacent Mens Rea Contrasts by Search Outcome (RH5.6)

Adjacent-rung contrast	Estimate	95% HDI	P(> 0)	Supported	Supported count	Named-step rule
Expected outcome						
purposely - knowingly	0.132*	[0.016, 0.251]	.987	Yes	1 of 3	Not met
knowingly - recklessly	−0.215*	[−0.357, −0.076]	.001	No	1 of 3	Not met
recklessly - negligently	−0.024	[−0.160, 0.112]	.362	No	1 of 3	Not met
Unexpected outcome						
purposely - knowingly	−0.054	[−0.168, 0.060]	.176	No	0 of 3	Not met
knowingly - recklessly	−0.447*	[−0.585, −0.310]	< .001	No	0 of 3	Not met
recklessly - negligently	−0.444*	[−0.579, −0.313]	< .001	No	0 of 3	Not met

Note. RH5.6 required positive 95% HDIs for purposely − knowingly and recklessly − negligently in both outcome conditions. Knowingly − recklessly and the supported count were descriptive. Estimates are posterior medians; HDI = highest density interval; P(> 0) = posterior probability of a positive contrast. *95% HDI excludes zero.

The predicted H5a serial indirect effect was not credible in the primary model, the scenario-matched model, or any of the four other specifications (Table P2.29).

Table P2.29

Pilot 2 H5a Serial Indirect Effects Across Model Specifications

Specification	Indirect	95% HDI	P(> 0)	Excludes 0	Same sign and zero exclusion
Primary (preregistered exclusions, scale-aware priors)	0.213	[−0.043, 0.496]	.960	No	Yes
Scenario-matched pregnancy likelihood item	0.210	[−0.033, 0.491]	.964	No	Yes
No exclusions (full-sample refit)	0.208	[−0.034, 0.492]	.961	No	Yes
Prior sensitivity, narrow (x0.5 scale-aware SD)	0.180	[−0.029, 0.421]	.963	No	Yes
Prior sensitivity, wide (x2 scale-aware SD)	0.226	[−0.031, 0.531]	.964	No	Yes
Vignette-order covariate added	0.212	[−0.039, 0.503]	.960	No	Yes

Note. Estimates are unstandardized posterior medians. HDI = highest density interval; P(> 0) = posterior probability of a positive serial indirect effect. Agreement with the primary model refers to the effect direction and whether the 95% HDI excludes zero. The prior-width and scenario-order checks were not preregistered.

About this document

The full Study 1 models appear in S4, with additional analyses by research question in S5 through S10. Chapter 5 reports the main findings.

Table and figure numbers identify the study and the section (e.g., Table 1-S4.1 is the first table in S4). I place a table that belongs to several sections in the first one that lists it and use square brackets for references to tables or figures outside this supplement.

Study 1 Design and Materials

In Study 1, I examined judgments of a search warrant after a pregnancy loss using one affidavit carried forward from Pilot Study 2. I randomly assigned each participant to one of six conditions that crossed search-outcome information with the alleged offense. Table S1D.1 links the design to the study materials, and Figure S1D.1 shows the six conditions.

Table S1D.1

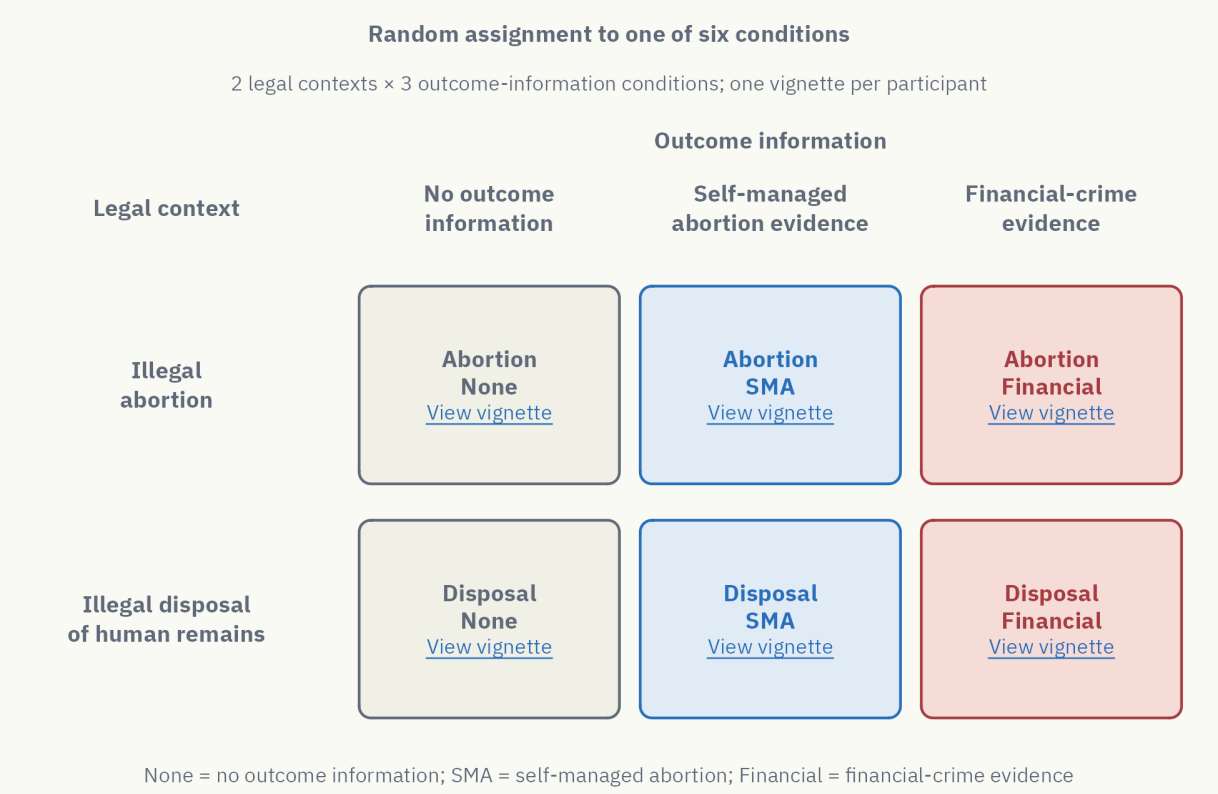

Study 1 Design and Materials

Component	What participants received	Materials
Design	3 search-outcome information levels × 2 alleged offenses, between participants; one vignette per participant.	Figure S1D.1 and the six condition links below
Affidavit and alleged offense	The non-criminal miscarriage affidavit from Pilot Study 2, modified for Study 1. The cited statute concerned illegal abortion or improper disposal of human remains.	Stimulus wording
Search-outcome information	No outcome information, self-managed-abortion evidence, or financial-crime evidence. Participants who received outcome information were instructed to disregard it when assessing the search.	Document-image previews
Judgments	One set of case judgments after the assigned vignette, followed by checks, attitude measures, and demographics.	Survey wording and departures

The Materials and Measures chapter reproduces the stimulus variations, survey questions, and response scales. It includes the registered probability-of-guilt item that participants did not see or answer; the deviations record documents that omission. The materials hub provides document-image previews. The preregistration and registered materials PDF provide the planned design and wording.

Figure S1D.1

The Six Experimental Conditions in Study 1

Note. None = no outcome information; SMA = self-managed-abortion evidence; Financial = financial-crime evidence. The six condition links below open the corresponding participant-view materials.

Condition Materials

- Illegal abortion, no outcome information
- Illegal abortion, self-managed-abortion evidence
- Illegal abortion, financial-crime evidence
- Improper disposal of human remains, no outcome information
- Improper disposal of human remains, self-managed-abortion evidence
- Improper disposal of human remains, financial-crime evidence

Study 1 Materials and Measures

The stimulus variations and study-specific survey questions are reproduced below. The stimulus materials and registered Study 1 materials and measures are also available.

Stimulus Wording

The two legal contexts differed only in the statute shown with the affidavit. Illegal abortion condition:

> **§ 47-101 — Unauthorized Termination of a Pregnancy; Criminal Abortion.** A person commits the offense of unauthorized termination of a pregnancy when he or she (1) *knowingly* performs, induces, or self-induces an abortion, otherwise than as authorized by law. The offense is punishable as a Class III felony.

Improper disposal condition:

> **§ 47-202 — Improper Disposal of Human Skeletal Remains; Abuse of Corpse.** A person commits the offense of improper disposal of human skeletal remains when he or she (1) *knowingly* removes, abandons, conceals, or otherwise disposes of human skeletal remains. The offense is punishable as a Class III felony.

A. Attention Checks

1. To show you are reading each question carefully, please choose ‘Neither Agree nor Disagree.’
2. We want to make sure your responses are thoughtful. Please choose ‘Strongly Agree’ for this item.
3. Please read all instructions carefully. For this question, select ‘Disagree’ as your answer.

B. Probable-Cause Judgments

Foresight instructions: “Probable cause exists if all the facts and circumstances, viewed through the lens of common sense, would make a reasonably prudent person think that a search would reveal contraband or evidence of the alleged crime. Based on the description of the facts you just read, is there probable cause to justify the search?”

Hindsight instructions: "Probable cause exists if all the facts and circumstances, viewed through the lens of common sense, would make a reasonably prudent person think that a search would reveal contraband or evidence of the alleged crime. Based on the description of the facts you just read, was there probable cause to justify the search?"

1. **Probable-cause ruling.** (Rachlinski et al., 2011) (**Binary**; *No, there [IS/WAS] not probable cause to justify the search / Yes, there [IS/WAS] probable cause to justify the search*)
2. **Confidence in PC ruling.** "How confident are you in this decision?" (**0–100 slider**; *0 = not at all confident, 100 = completely confident*)
3. **Subjective probability of guilt.** (Baucum et al., 2018) "Based on the evidence available at the time the warrant was sought, what is the probability that the suspect committed the crime the detective suspects her of committing?" (**0–100 slider**; *Probability (0–100%)*; the selected value displays with a percent sign.) Item text is Pilot Study 2′s verbatim and is identical across outcome conditions.

C. Outcome Likelihood Estimates (Fischhoff, 1975; Nestler & Egloff, 2009)

Foresight instructions: "You are the judge who has been asked to authorize this search. Based only on the affidavit you just read and what the detective knew when seeking the warrant, please rate the likelihood of each of the following outcomes of the requested search. There are many possible outcomes; please rate each outcome independently. (0 = not at all likely; 100 = completely likely)"

Hindsight instructions: "Think back to the time when the detective asked you to authorize the search, before it was carried out. Putting yourself back at that moment and deciding based only on what was known then, as if you did not know what the search ultimately revealed, please rate the likelihood of each of the following outcomes of the requested search. There are many possible outcomes; please rate each outcome independently. (0 = not at all likely; 100 = completely likely)"

1. The search reveals evidence that the suspect illegally obtained an abortion to end her own pregnancy (e.g., records of obtaining abortion medication outside formal medical care, or related online activity). (*0–100%*)
2. The search reveals evidence that the suspect improperly disposed of the fetal remains or concealed the loss following a miscarriage or stillbirth (e.g., records of disposal arrangements made after the loss, or other indications of improper handling of the remains). (*0–100%*)

3. The search reveals evidence that the suspect committed an unrelated crime (e.g., stolen credit cards and associated records, or other evidence of a financial crime). (*0–100%*)
4. The search reveals nothing illegal or incriminating. (*0–100%*)

D. Foreseeability Impressions Items Index (Blank et al., 2008)

Strongly disagree	**Disagree**	**Neither agree nor disagree**	**Agree**	***Strongly agree***
1	2	3	4	5

Instructions: "Please indicate how strongly you agree or disagree with each statement as a description of the scenario you read about."

Foresight items:

1. The detective knows, at the time he seeks the warrant, what the search will reveal.
2. It is difficult for the detective to predict what the search will reveal when he decides to seek the warrant. *(reverse-scored)*
3. The detective has a clear and vivid idea of what the search will reveal at the time he seeks the warrant.
4. Overall, from the detective's perspective, the outcome of the search is foreseeable.
5. Overall, from the detective's perspective, it is foreseeable that the search will uncover evidence of some offense. (*general item*)

Hindsight items:

1. The detective would have known all along what the search would reveal at the time he sought the warrant.
2. It was difficult for the detective to predict what the search would reveal when he decided to seek the warrant. *(reverse-scored)*
3. The detective had a clear and vivid idea of what the search would reveal at the time he sought the warrant.
4. Overall, from the detective's perspective, the outcome of the search was foreseeable.
5. Overall, from the detective's perspective, it was foreseeable that the search would uncover evidence of some offense. (*general item*)

E. Quality of the Detective's Decision

Strongly disagree	Disagree	Somewhat disagree	Neither agree nor disagree	Somewhat agree	Agree	*Strongly agree*
1	2	3	4	5	6	7

Instructions: "Think back to the time when the detective decided to seek the warrant and rate the quality of his decision."

Foresight items:

1. The process leading to the detective's decision to seek the warrant is clear and transparent.
2. The detective's decision is fair and unbiased.
3. Any reasonable detective in this position would make the same decision.
4. The decision is made responsibly, taking all relevant information into account.
5. Overall, it is a good decision to seek the warrant.

Hindsight items:

1. The process leading to the detective's decision to seek the warrant was clear and transparent.
2. The detective's decision was fair and unbiased.
3. Any reasonable detective in this position would have made the same decision.
4. The decision was made responsibly, taking all relevant information into account.
5. Overall, it was a good decision to seek the warrant.

F. Severity of Consequences

Item: "How serious are the consequences of what happened in this case?"

Not at all serious						*Extremely serious*
1	2	3	4	5	6	7

G. Relevance Ratings of the Search Scenario

Foresight instructions: "Next, we would like you to rate how relevant you think each of the following items from the situation leading up to the search were to what the search would reveal."

Hindsight instructions: "Next, we would like you to rate how relevant you think each of the following items from the situation leading up to the search were to what the search revealed."

Not at all relevant								***Extremely relevant***
1	2	3	4	5	6	7	8	9

Evidence Items:

1. That an anonymous coworker reported that the suspect was no longer pregnant.
2. That the suspect had been trying to conceive and was openly excited about her pregnancy.
3. That the suspect had held a stable job for several years.
4. That the suspect had told her husband, her doctor, and her workplace about her pregnancy.
5. That the suspect had been receiving prenatal care from an obstetrician.
6. That the suspect said she was alone when she lost her pregnancy at home.
7. That the suspect retrieved the remains from the toilet and buried them in her backyard.
8. That the suspect sought emergency care at the hospital after losing her pregnancy.
9. That the suspect experienced cramping and heavy bleeding and was treated for hemorrhage and retained tissue.
10. That the suspect was 32 years old and lived with her husband.

H. Moral Judgments of the Suspect

Suspect Mens Rea (MPC Culpability) (Kneer & Skoczeń, 2023)

Instructions: Please indicate your agreement or disagreement with each of the following statements about the suspect's state of mind.

Strongly disagree	**Disagree**	**Somewhat disagree**	**Neither agree nor disagree**	**Somewhat agree**	**Agree**	***Strongly agree***
1	2	3	4	5	6	7

1. It was the suspect's purposeful objective to end their own pregnancy. *(purposefully)*
2. The suspect was practically certain that their pregnancy would end. *(knowingly)*
3. The suspect was aware of a substantial risk that their pregnancy would end. *(recklessly)*
4. The suspect should have been aware of a substantial risk that their pregnancy would end. *(negligently)*

Moral Seriousness (Davis, 2006)

1. **Mal in se:** The suspect's conduct was morally wrong, even apart from whether the law prohibits it. (*1 = strongly disagree to 7 = strongly agree*)

2. **Charge Wrongness:** Given the offense the suspect is suspected of committing, how morally wrong was her conduct? (*1 = not at all, 4 = somewhat, 7 = very much*)

Counterfactual Availability (Roese & Olson, 1996)

1. **Counterfactual:** How easy is it for you to imagine an alternative to the suspect's conduct that would have led to a different outcome? (*1 = not at all easy to 7 = extremely easy*)

I. Suspect's Moral Culpability and Blame (Alicke, 2000; Malle et al., 2014)

1. **Suspect Blame:** "To what extent is the suspect blameworthy for what happened?" (*1 = not at all blameworthy to 7 = extremely blameworthy*)
2. **Suspect Responsibility:** "How responsible is the suspect for what happened?" (*1 = not at all responsible to 7 = completely responsible*)
3. **Suspect Punishment:** "How much punishment does the suspect deserve for what happened?" (*1 = no punishment at all to 7 = very severe punishment*)
4. **Suspect Causality:** "To what extent did the suspect's actions cause the pregnancy loss?" (*1 = not at all a cause to 7 = very strong cause*)
5. **Suspect Reasons:** "Did the suspect have justified reasons for her conduct during the pregnancy?" (*1 = not at all justified to 7 = completely justified*)
6. **Suspect Preventability:** Could the suspect have prevented the pregnancy loss? (*1 = definitely not to 7 = definitely yes*)
7. **Suspect Character:** "Given what you know about the suspect from these case materials, do you have a generally favorable or unfavorable impression of her?" (*1 = very unfavorable to 7 = very favorable*)
8. **Suspect Wrongness:** "Was the suspect's conduct during the pregnancy morally wrong?" (1 = *not at all*, 4 = *somewhat*, 7 = *very much*)

J. Detective's Moral Culpability and Blame

1. **Officer Blame:** "To what extent is the detective blameworthy for his decision to seek the warrant?" (0 = *not at all blameworthy* to 10 = *extremely blameworthy*)
2. **Officer Consequences:** How severe a consequence should the detective face for his decision to seek the warrant? (0 = *no consequence at all* to 10 = *very severe consequence*)
3. **Officer Wrongness:** How right or wrong was the detective's decision to seek the warrant? (0 = *not wrong at all* to 10 = *very wrong*)

K. Search-Target Endorsement

Instructions: Imagine the same investigation you just read about. Now suppose that, instead of seeking to search the suspect's phone, the detective stated that there was probable cause to carry out each of the searches described below. For each one, please answer the two questions that follow.

1. **Reverse keyword warrant:** A court order directing a technology company to identify any person who recently searched for specified pregnancy-related or abortion-related terms on the company's search engine."
2. **Provider text-message content warrant:** A warrant served on the suspect's cellular-service provider compelling disclosure of the content of the suspect's text messages.
3. **Physical home search:** A warrant authorizing law enforcement officers to physically search the suspect's home.

Participants answered two questions for each target:

1. **Search endorsement:** "Would you approve of a law enforcement officer conducting this search?" (*Yes / No*)
2. **Certainty threshold:** "What percentage certain would you have to be that the suspect committed the offense described in the affidavit before approving this search?" (*Certainty required, 0–100%*)

After all three targets, participants answered one further question for each target:

Instructions: "We have a few more questions about the searches you just considered. For each of the following searches, please rate how likely it is that the search would uncover evidence of the offense, assuming, hypothetically, that the suspect had committed it."

1. "If the suspect had indeed committed the offense described in the affidavit, what is the probability that a reverse keyword warrant on online search history would uncover evidence of it?" (*0% = not at all likely; 100% = completely likely*)
2. "If the suspect had indeed committed the offense described in the affidavit, what is the probability that a warrant for the suspect's text-message communications would uncover evidence of it?" (*0% = not at all likely; 100% = completely likely*)
3. "If the suspect had indeed committed the offense described in the affidavit, what is the probability that a physical search of the suspect's residence would uncover evidence of it?" (*0% = not at all likely; 100% = completely likely*)

L. Manipulation Checks

Comprehension Check

Instructions: "Please indicate which of the following statements are true about the case you just read. Check all that apply."

1. The suspect identified in the affidavit was named Mary Johnston. [TRUE]
2. The suspect was married and had been actively trying to conceive. [TRUE]
3. The suspect did not disclose the pregnancy to her workplace. [FALSE]

Outcome Manipulation Check

Instructions: "What did the search reveal at the end of the affidavit you read?"

- Evidence consistent with the suspect's intentional termination of the pregnancy, concealment of the loss, or improper disposal of remains [HACE]
- Evidence of unrelated credit-card fraud [HUCE]
- The search results were not shown; the warrant was authorized but no results were yet available [F]
- I cannot recall what the search revealed

Legal Context Manipulation Check

Instructions: "Which of the following best describes the statute the affiant cited as the basis for seeking the warrant in the case you read?"

- A state felony statute criminalizing the unauthorized termination of a pregnancy [Ab]
- A state felony statute criminalizing the improper disposal of human skeletal remains [Di]
- A federal statute governing interstate transport

- I cannot recall which statute was cited

Gestational-Age Estimate (Exploratory)

Instructions: "Based only on what you read, about how far along do you think the pregnancy was when the loss occurred?"

1. Early in the pregnancy (first trimester, roughly 1–12 weeks)
2. Around the middle (early second trimester, roughly 13–20 weeks)
3. Later in the pregnancy (late second trimester or beyond, roughly 21+ weeks)
4. Unsure / can't tell from the affidavit

M–S. Individual-Difference Measures and Demographics

The six individual-difference scales and the demographic items were administered with the same items in Pilot 2, Study 1, and Study 2 and are provided in the registered Study 1 materials and measures: the Modified Abortion Attitude Scale, Support for Punishment of Women for Miscarriage, the Ambivalent Sexism Inventory short form, the religiosity scale, the political-orientation items, the Outcome Preference Measure, and the demographic items.

S1. Deviations from the registration

The Study 1 analysis departs from the registration (https://osf.io/93w7p/) in two ways, summarized below. The Study 1 deviations record is included in this supplement (https://doi.org/10.5281/zenodo.23424192).

Summary

	Item	Category	When decided	Effect on the severity of the test	Effect on validity
2.	Pregnancy-evidence likelihood as the mediator for H3c–H3e	A mistake in the study	After data collection ended and before any Study 1 outcome was analyzed	Reduced. The registered mediator was not recorded, so a different registered measure stands in for it and is reported as a substitute.	Lower for the registered construct. The substitute tests the closest measured route.
4.	Relative relevance in place of the ten-item mean as the mediator for H1 and H4b–H4d	A mistake in the preregistration	After the Study 1 data had been analyzed	Reduced. I chose the new mediator with the registered results in hand. The registered results are reported in this supplement.	Increased. Relative relevance measures the shift that the hypotheses predict.

I evaluate each departure's effect on the severity of the test and on validity following Lakens (2024). The Study 1 deviations record gives the registered wording, the reasons and the full evaluation of both items.

2. Substitute Mediator (H3c–H3e)

A survey glitch prevented administration of the registered probability-of-guilt item, so the registered H3c–H3e test could not run. After data collection, before analyzing any Study 1 outcome or inspecting likelihood or blame values, I substituted pregnancy-evidence likelihood: the registered 0–100 abortion/disposal likelihood composite also used in E9a–E9b, with the original model, intervals, and support rules. It concerns finding evidence rather than guilt, so I report it as a substitute; foreseeability, which concerns predictability from the detective's

perspective, carries no directional E9 prediction. The timing limits my discretion over the substitute but cannot establish severity for a registered test that could not run. S7 reports the substitute analysis; Chapter 5 reports H3a–H3b and footnotes the unavailable registered H3c–H3e tests.

4. Relative Relevance (H1; H4b–H4d)

In place of the registered ten-item mean, the Chapter 5 mediator for H1 and H4b–H4d is relative relevance: the mean of E4a's items consistent with self-managed abortion (1, 6, and 7) minus the mean of the other items. I changed only the relevance measure; the other specifications and decision rules follow the registration. Because the key fits the self-managed abortion outcome only, relative relevance does not test sense-making after financial-crime evidence (H1b and H4c). I chose the replacement only after seeing the registered results, which reduced the severity of these tests, although the score measures the predicted contrast more directly; their H1a–H1d and H4b–H4d decisions may differ from the registered decisions. The registered results based on the ten-item mean are reported in this supplement.

S2. Measurement and reliability

Notes shared by tables of this section.

- Tables 1-S2.11, 1-S2.15, 1-S2.17 and 1-S2.20 to 1-S2.22: Added analysis, not registered: evidence relevance is measured by two latent factors from eight of the ten relevance items (items 3 and 10 dropped), and each factor is a separate mediator.
- Tables 1-S2.11, 1-S2.15, 1-S2.17 and 1-S2.20 to 1-S2.22: For a relevance pathway the estimate is the sum across factors, the quantity the registration names and the one the registered decision rule reads ("the indirect association through each factor and the sum across factors"); the per-factor components carry no decision rule.
- Tables 1-S2.11, 1-S2.20 and 1-S2.22: Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 10,000 usable.
- Tables 1-S2.11, 1-S2.15, 1-S2.17 and 1-S2.20 to 1-S2.22: — = no factor component (not a relevance pathway).
- Tables 1-S2.11 and 1-S2.20: Primary set: grouped, as in the registered run.
- Tables 1-S2.11, 1-S2.12, 1-S2.15, 1-S2.16 and 1-S2.20 to 1-S2.22: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information.
- Tables 1-S2.11, 1-S2.12, 1-S2.16 to 1-S2.18 and 1-S2.20 to 1-S2.22: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).
- Tables 1-S2.12 and 1-S2.18: Paths are in original units, with each relevance factor on its marker item's 1–9 scale. Robust standard errors supply normal Wald 95% intervals. The a paths vary by legal context; the b paths are shared.
- Tables 1-S2.13 and 1-S2.19: These models use eight observed relevance items instead of their mean. The fit indices and degrees of freedom are not directly comparable with those of the registered model. Tables 1-S2.13, 1-S2.19, and 1-S2.23 report lavaan's robust RMSEA with 90% CIs.
- Tables 1-S2.17 and 1-S2.18: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.

Table 1-S2.1

Cronbach's alpha with Feldt 95% intervals for every scored composite, primary sample

Scale	n complete	k	alpha	alpha 95% CI
Pregnancy-evidence likelihood	398	2	.68	[.61, .73]
Foreseeability	398	4	.83	[.80, .85]
Decision quality	398	5	.95	[.95, .96]
Evidence relevance	398	10	.83	[.80, .85]
Culpability	398	4	.95	[.94, .95]
Abortion attitudes	398	14	.97	[.96, .97]
Support for punishment	398	6	.85	[.83, .88]
Benevolent sexism	398	6	.86	[.84, .88]
Hostile sexism	398	6	.94	[.93, .95]
Religiosity	398	4	.93	[.91, .94]

Note. k = number of items; n complete = number of participants with complete responses to all items in the composite; α = Cronbach's alpha; CI = confidence interval. Estimates followed the registered item reversals. Religiosity items were standardized against the primary sample; the other estimates used raw item scores. CIs are Feldt normal-theory intervals.

Table 1-S2.2

Evidence Relevance Measurement Candidates and Registered Selection Criteria

Candidate	Item pattern admissible	All three fits admissible	Registered criteria met	Scalar BIC	Selected	Reason
One-factor	yes	no	no		no	At least one invariance fit failed numerical requirements
Three-factor	no	no	no		no	Fewer than three qualifying indicators on a factor

Note. BIC = Bayesian information criterion. To be eligible, a candidate needed admissible configural, metric, and scalar fits that met the registered criteria. Among eligible candidates, the selection rule would have chosen the one with the lowest scalar BIC, or one with fewer factors if its BIC was less than 2 above that minimum. None of the candidates was eligible, so I kept the registered ten-item mean. I did not use modification indices or partial invariance.

The scaled χ^2 and SRMR of the candidates' fits at each invariance step (one-factor, metric; one-factor, scalar) are in Table 1-S2.3, with the robust CFI and RMSEA the registered selection reads.

Table 1-S2.3

Invariance sequence of each candidate against the registered criteria

Model	Numerical requirements	Scaled χ^2 (df)	Robust CFI	Robust RMSEA [90% CI]	SRMR	Delta CFI	Delta RMSEA	Delta SRMR	Criterion met
One-factor, Configural	Did not converge	—	—	—	—	—	—	—	not evaluated
One-factor, Metric	met	665.38 (255)	.714	.165 [.150, .180]	.149	—	—	—	not evaluated
One-factor, Scalar	met	752.50 (300)	.691	.158 [.144, .172]	.162	−.023	−.007	.013	not evaluated

Note. Configural: robust CFI at least 0.9, robust RMSEA at most 0.08 and SRMR at most 0.08. Each added set of equalities may lower CFI by at most 0.01 and raise RMSEA by at most 0.015, and SRMR may rise by at most 0.03 (metric) or 0.01 (scalar). Criterion met = result for each step, evaluated only when all three fits meet the numerical requirements. Changes require two adjacent fits meeting those requirements. MLR = robust maximum likelihood estimation; χ^2 = Yuan–Bentler scaled chi-square statistic; CFI = comparative fit index; RMSEA = root mean square error of approximation; SRMR = standardized root mean square residual; CI = confidence interval. Robust CFI and RMSEA are reported. Did not converge: One-factor, Configural: the projected gradient of the fit, 0.000241695, was above the convergence tolerance.

Table 1-S2.4

Alternative measurement structures, ten items: the two- and three-factor pattern loadings

	Two factors			Three factors			
Item	**E1**	**E2**	**Factor**	**E1**	**E2**	**E3**	**Factor**
1	.61	−.06	E1	.59	−.07	.10	E1
2	−.07	.83	E2	−.09	.84	.01	E2
3	.02	.32	E2	−.03	.04	.67	E3
4	−.06	.82	E2	−.07	.77	.10	E2
5	.01	.80	E2	−.004	.76	.10	E2
6	.67	.05	E1	.66	−.02	.22	E1
7	.73	−.01	E1	.72	.07	−.09	E1
8	.22	.61	E2	.20	.70	−.10	E2
9	.39	.42	E2 (not qualifying)	.37	.51	−.10	E2 (not qualifying)
10	.13	.36	E2	.10	.07	.70	E3

Note. Oblimin-rotated minimum-residual pattern loadings of the within-condition item correlations (psych::fa(), n = 392 [complete responses minus the six condition means]) at two and three factors. Factor identifies the item's assignment by its largest absolute loading. Qualification requires that loading to reach .30 and its excess over the next largest absolute loading to reach .20. Two factors: item 9 on E2 does not qualify (loading .424, gap to its next loading .038). Three factors: item 9 on E2 does not qualify (loading .513, gap to its next loading .142).

Table 1-S2.5

Alternative measurement structures, ten items: the registered pattern screen of the two- and three-factor candidates

Candidate	Items per factor	Qualifying items	Factor correlations	Screen
Two-factor	E1: 1, 6, 7; E2: 2, 3, 4, 5, 8, 9, 10	E1: 3; E2: 6	E1–E2 .447	passes
Three-factor	E1: 1, 6, 7; E2: 2, 4, 5, 8, 9; E3: 3, 10	E1: 3; E2: 4; E3: 2	E1–E2 .414; E1–E3 .158; E2–E3 .341	fails: fewer than three qualifying indicators on a factor (E3)

Note. The registered pattern screen: an item qualifies when its largest absolute loading is at least .30 and exceeds its next loading by at least .20; each factor needs at least 3 qualifying items; every factor correlation must be below .90 in absolute value; no factor may be empty. The three-factor assignment is the one Pilot 2′s pooled three-factor structure found.

Table 1-S2.6

Alternative measurement structures, ten items: the two-factor candidate through the registered invariance steps

Step	Numerical requirements	Robust CFI	Robust RMSEA [90% CI]	SRMR	BIC
Configural	Did not converge	—	—	—	—
Metric	met	.820	.134 [.117, .150]	.117	929.5
Scalar	met	.808	.128 [.112, .143]	.124	749.4

Note. Invariance tests of the two-factor pattern, with the highest-loading item of each factor as its marker. The candidate is inadmissible (at least one invariance fit failed numerical requirements), so the analysis evaluates no criteria and records no scalar BIC. The registered selection over the registered candidates (one and three factors): none; over one, two and three factors: none. The ten-item mean stands. Did not converge: Configural: the fit did not reach an admissible solution (an estimated observed-variable variance was negative) after 2 attempts.

Table 1-S2.7

Alternative measurement structures, eight items (added analysis, not registered): the candidates through the registered loop

Candidate	Built by	Items per factor	Screen	All three fits admissible	Registered criteria met	Scalar BIC	Selected
One-factor	registered loop (always considered)	E1: 1, 2, 4, 5, 6, 7, 8, 9	does not apply	no	not evaluated	—	no
Two-factor	registered loop (indicated)	E1: 1, 6, 7; E2: 2, 4, 5, 8, 9	passes	no	not evaluated	—	no

Note. The registered candidate loop (one factor, plus the parallel-analysis k if it is two or three) through the registered candidate, invariance, and selection steps. Reasons: One-factor, at least one invariance fit failed numerical requirements; Two-factor, at least one invariance fit failed numerical requirements. Selection over the registered loop's candidates: none.

Table 1-S2.8

Alternative measurement structures, eight items (added analysis, not registered): the one-, two- and three-factor pattern loadings

	One factor	Two factors			Three factors			
Item	**E1**	**E1**	**E2**	**Factor**	**E1**	**E2**	**E3**	**Factor**
1	.36	.61	−.07	E1	.66	.04	−.10	E1
2	.72	−.08	.85	E2	−.03	.76	.10	E2
4	.70	−.05	.81	E2	.05	.88	−.08	E2
5	.74	.02	.78	E2	−.02	.56	.29	E2
6	.47	.66	.03	E1	.64	.06	.03	E1
7	.50	.73	.01	E1	.64	−.05	.17	E1
8	.78	.21	.65	E2	−.01	.20	.67	E3
9	.71	.38	.45	E2 (not qualifying)	.12	−.04	.74	E3

Note. Oblimin-rotated minimum-residual pattern loadings of the eight items at two and three factors. The one-factor loadings are descriptive: the one-factor pattern is built without an EFA (marker item 1), and no screen applies to it. Two factors: item 9 on E2 does not qualify (loading .452, gap .071). Factor correlations: two factors .443; three factors E1–E2 .303, E1–E3 .540, E2–E3 .678.

Table 1-S2.9

Alternative measurement structures, eight items (added analysis, not registered): the admissible candidates through the registered invariance steps

Model	Numerical requirements	Robust CFI	Robust RMSEA [90% CI]	SRMR	BIC
One-factor, Configural	Did not converge	—	—	—	—
One-factor, Metric	met	.778	.172 [.151, .192]	.152	750.7
One-factor, Scalar	met	.748	.165 [.147, .184]	.169	617.3
Two-factor, Configural	Did not converge	—	—	—	—

Model	Numerical requirements	Robust CFI	Robust RMSEA [90% CI]	SRMR	BIC
Two-factor, Metric	met	.904	.117 [.093, .141]	.101	633.7
Two-factor, Scalar	met	.886	.116 [.094, .137]	.112	508.6

Note. Invariance tests of each admissible eight-item pattern used the MLR fits with FIML, the six conditions as groups, 2,000 and then 10,000 iterations, and the numerical requirements of the analysis (including the projected gradient below 1e-4). A candidate whose fits do not all meet them is inadmissible, and the analysis evaluates no criteria for it. Did not converge: One-factor, Configural: the projected gradient of the fit, 0.000741189, was above the convergence tolerance after 2 attempts; Two-factor, Configural: the fit did not reach a converged, admissible solution after 2 attempts.

Table 1-S2.10

Two-factor evidence relevance (added analysis, not registered): the eight relevance items, their factors and markers

Item	Wording	Factor	Marker	EFA loading
1	That an anonymous coworker reported that the suspect was no longer pregnant	Factor 1		.615
6	suspect said she was alone when she lost her pregnancy at home	Factor 1		.657
7	suspect retrieved the remains from the toilet and buried them in her backyard	Factor 1	Yes	.733
2	suspect had been trying to conceive and was openly excited about her pregnancy	Factor 2	Yes	.847
4	suspect had told her husband, her doctor, and her workplace about her pregnancy	Factor 2		.807
5	suspect had been receiving prenatal care from an obstetrician	Factor 2		.783
8	suspect sought emergency care at the hospital after losing her pregnancy	Factor 2		.647
9	suspect experienced cramping and heavy bleeding and was treated for hemorrhage and retained tissue	Factor 2		.452

Item	Wording	Factor	Marker	EFA loading
3	suspect had held a stable job for several years	Dropped		—
10	suspect was 32 years old and lived with her husband	Dropped		—

Note. Factor 1: coefficient H = .669, AVE = .421, α = .702; factor 2: H = .859, AVE = .550, α = .869 (H and AVE: means over the six conditions of the scalar fit's model-implied values; α over complete responses). Eight items together: α = .833. Assignment and markers by the pattern rule of the analysis (highest absolute loading); the assignment equals the item-consistency key. EFA loadings: minres, oblimin, within-condition centered items. Added analysis, not registered: not the registered measurement decision, which is the ten-item mean.

Table 1-S2.11

Two-factor evidence relevance (added analysis, not registered): indirect effects of outcome information on pregnancy-evidence likelihood and foreseeability, by legal context

Pathway	Letter	Added analysis, not registered			
		Through factor 1	Through factor 2	Estimate [95% CI]	Decision
Illegal abortion					
Expected evidence → relevance → likelihood	H1a	−1.057 [−5.210, 2.780]	3.028 [0.793, 6.368]	1.971 [−2.264, 6.756]	not supported
Unexpected evidence → relevance → likelihood	H1b	−2.727 [−7.712, 1.630]	1.784 [−0.042, 4.648]	−0.942 [−5.413, 3.441]	not supported
Expected evidence → severity → foreseeability	H1c	—	—	−0.001 [−0.023, 0.018]	not supported
Unexpected evidence → severity → foreseeability	H1d	—	—	0.0000 [−0.019, 0.019]	not supported
Improper disposal					
Expected evidence → relevance → likelihood	H1a	3.255 [−0.445, 7.788]	2.415 [0.590, 5.179]	5.670 [1.705, 10.860]	supported

Pathway	Letter	Added analysis, not registered			
		Through factor 1	Through factor 2	Estimate [95% CI]	Decision
Unexpected evidence → relevance → likelihood	H1b	−1.288 [−5.817, 3.074]	1.517 [−0.128, 4.245]	0.229 [−3.391, 4.234]	not supported
Expected evidence → severity → foreseeability	H1c	—	—	0.012 [−0.032, 0.055]	not supported
Unexpected evidence → severity → foreseeability	H1d	—	—	−0.004 [−0.036, 0.014]	not supported

Note. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported in Table 1-S5.1, unchanged. H1c and H1d run through consequence severity, which the two-factor analysis does not change; they are re-estimated in the two-factor model.

Table 1-S2.12

Two-factor evidence relevance (added analysis, not registered): paths of the hindsight-pathway model through the two relevance factors, by legal context

Path	Illegal abortion		Improper disposal		Equal across contexts
	b (SE)	95% CI	b (SE)	95% CI	
a paths: outcome information → relevance factor					
Expected evidence → Factor 1	−0.187 (0.346)	[−0.864, 0.490]	0.576 (0.325)	[−0.062, 1.214]	No
Unexpected evidence → Factor 1	−0.483 (0.402)	[−1.270, 0.305]	−0.228 (0.383)	[−0.978, 0.522]	No
Expected evidence → Factor 2	−1.478 (0.382)	[−2.227, −0.729]	−1.179 (0.336)	[−1.837, −0.521]	No
Unexpected evidence → Factor 2	−0.871 (0.439)	[−1.731, −0.011]	−0.741 (0.414)	[−1.552, 0.070]	No

Path	Illegal abortion		Improper disposal		Equal across contexts
	b (SE)	95% CI	b (SE)	95% CI	
b paths: relevance factor → pregnancy-evidence likelihood					
Factor 1 → pregnancy-evidence likelihood	5.650 (1.062)	[3.569, 7.731]	5.650 (1.062)	[3.569, 7.731]	Yes
Factor 2 → pregnancy-evidence likelihood	−2.048 (0.742)	[−3.504, −0.593]	−2.048 (0.742)	[−3.504, −0.593]	Yes

Note. Two-factor analysis (added analysis, not registered), registered model with the attitudes, primary sample.

Table 1-S2.13

Two-factor evidence relevance (added analysis, not registered): global fit of the hindsight-pathway model

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
Two-factor analysis (added analysis, not registered)					
Registered model	332.61 (191)	< .001	.932	.062 [.050, .074]	.060
Without attitudes	246.83 (123)	< .001	.918	.074 [.060, .088]	.070
Pooled contexts	341.50 (197)	< .001	.930	.062 [.050, .073]	.062
Pooled contexts, without attitudes	255.51 (129)	< .001	.917	.073 [.060, .086]	.073

Note. Primary sample. The registered model's fits (the ten-item mean) are in Table 1-S4.1.

Table 1-S2.14

Two-factor evidence relevance (added analysis, not registered): variance explained in each equation of the hindsight-pathway model, decision-quality model and probable cause–confidence model, by legal context

Equation	Hindsight-pathway model		Decision-quality model		Probable cause–confidence model	
	Illegal abortion	**Improper disposal**	**Illegal abortion**	**Improper disposal**	**Illegal abortion**	**Improper disposal**
Factor 1 (items 1, 6, 7)	.117	.126	.117	.127	.117	.126
Factor 2 (items 2, 4, 5, 8, 9)	.079	.063	.079	.063	.079	.063
Consequence severity	.030	.089	.030	.089	.030	.089
Pregnancy-evidence likelihood	.273	.262	.273	.262	.273	.262
Foreseeability	.099	.111	.099	.111	.099	.111
Decision quality	—	—	.507	.555	—	—
Scalar probable cause–confidence	—	—	—	—	.319	.470

Note. R^2 of each endogenous variable of each two-factor model with the attitudes (lavaan), primary sample, by legal context. — marks an equation the model does not have.

Table 1-S2.15

Two-factor evidence relevance (added analysis, not registered): indirect effects of outcome information on pregnancy-evidence likelihood and foreseeability in the sensitivity sample, beside the registered results

		Added analysis, not registered				Registered, ten-item mean	
Pathway	**Letter**	**Through factor 1**	**Through factor 2**	**Estimate [95% CI]**	**Decision**	**Estimate [95% CI]**	**Decision**
Illegal abortion							
Expected evidence → relevance → likelihood	H1a	−1.445 [−6.183, 2.691]	4.157 [1.170, 8.691]	2.713 [−2.117, 8.541]	not supported	−1.773 [−3.782, −0.352]	not supported
Unexpected evidence → relevance → likelihood	H1b	−3.747 [−9.466, 0.905]	2.164 [−0.103, 5.741]	−1.583 [−6.592, 3.247]	not supported	−1.232 [−3.141, −0.008]	supported
Expected evidence → severity → foreseeability	H1c	—	—	−0.003 [−0.034, 0.019]	not supported	−0.001 [−0.028, 0.023]	not supported
Unexpected evidence → severity → foreseeability	H1d	—	—	−0.001 [−0.026, 0.021]	not supported	−0.0003 [−0.021, 0.020]	not supported
Improper disposal							
Expected evidence → relevance → likelihood	H1a	3.917 [−0.124, 9.107]	2.792 [0.629, 6.134]	6.709 [2.296, 12.854]	supported	−0.569 [−1.763, 0.347]	not supported
Unexpected evidence → relevance → likelihood	H1b	−1.432 [−6.496, 3.587]	2.207 [0.014, 5.926]	0.775 [−3.192, 5.432]	not supported	−0.750 [−2.394, 0.479]	not supported
Expected evidence → severity → foreseeability	H1c	—	—	0.012 [−0.044, 0.064]	not supported	0.004 [−0.054, 0.054]	not supported

		Added analysis, not registered				Registered, ten-item mean	
Pathway	**Letter**	**Through factor 1**	**Through factor 2**	**Estimate [95% CI]**	**Decision**	**Estimate [95% CI]**	**Decision**
Unexpected evidence → severity → foreseeability	H1d	—	—	−0.003 [−0.039, 0.018]	not supported	−0.001 [−0.031, 0.023]	not supported

Note. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are the registered ones, unchanged. Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 9,999 usable. Sensitivity sample: the registered participant exclusions; the registered columns are the registered sensitivity results. n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).

Table 1-S2.16

Two-factor evidence relevance (added analysis, not registered): legal-context comparisons of the hindsight pathways

	Added analysis, not registered		
Comparison	**Factor 1**	**Factor 2**	**Model**
Evidence relevance (E1a)			
Expected evidence → relevance	−0.763 [−1.665, 0.139]	−0.299 [−1.288, 0.690]	—
Unexpected evidence → relevance	−0.255 [−1.310, 0.800]	−0.130 [−1.307, 1.046]	—
Expected evidence → relevance → likelihood	—	—	−3.699 [−9.581, 1.341]
Unexpected evidence → relevance → likelihood	—	—	−1.171 [−7.083, 4.193]
Joint test: relevance paths	—	—	$\chi^2(4) = 2.18$, $p = .702$

	Added analysis, not registered		
Comparison	**Factor 1**	**Factor 2**	**Model**
Consequence severity (E1b)			
Expected evidence → severity	—	—	−0.749 [−1.484, −0.015]
Unexpected evidence → severity	—	—	0.232 [−0.529, 0.992]
Expected evidence → severity → foreseeability	—	—	−0.013 [−0.066, 0.036]
Unexpected evidence → severity → foreseeability	—	—	0.004 [−0.020, 0.042]
Joint test: severity paths	—	—	$\chi^2(2) = 7.25$, $p = .027$
Joint test: every first-stage path	—	—	$\chi^2(6) = 8.75$, $p = .188$

Note. Abortion minus disposal, primary sample, registered model with the attitudes; reported without a verdict, as registered. Coefficient differences: robust Wald 95% intervals; indirect-effect differences: bootstrap percentile intervals; joint tests: scaled χ^2 differences. In the two-factor analysis each relevance path is a factor path, so each registered comparison of the single relevance mediator has a per-factor analogue; the joint relevance test there covers all four factor paths. The registered comparisons (the ten-item mean) are in Table 1-S5.2.

The two-factor analysis (added analysis, not registered) leaves H2a and H2b unchanged: in each legal context its estimates, intervals and decisions are the registered ones (the estimates are in Table 1-S4.12).

Table 1-S2.17

Two-factor evidence relevance (added analysis, not registered): direct and serial indirect paths to decision quality, by legal context

Pathway	Letter	Added analysis, not registered			
		Through factor 1	**Through factor 2**	**Estimate [95% CI]**	**Decision**
Illegal abortion					
Expected evidence → direct path to decision quality	E6a	—	—	−0.031 [−0.480, 0.418]	not supported
Unexpected evidence → direct path to decision quality	E6b	—	—	0.465 [0.010, 0.919]	supported
Expected evidence → relevance → likelihood → decision quality	E6c	−0.022 [−0.125, 0.067]	0.067 [0.015, 0.153]	0.045 [−0.050, 0.163]	not supported
Unexpected evidence → relevance → likelihood → decision quality	E6d	−0.060 [−0.186, 0.036]	0.040 [0.0001, 0.107]	−0.021 [−0.133, 0.080]	not supported

Unexpected evidence → severity → foreseeability → decision quality	E6f	—	—	−0.002 [−0.017, 0.006]	not supported

Note. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported in Tables 1-S6.2 and 1-S6.3, unchanged. Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 9,996 usable. E6a and E6b are direct paths (robust Wald intervals, as registered); E6c–E6f are serial products (bootstrap intervals). E6e and E6f run through consequence severity and have no factor components.

Table 1-S2.18

Two-factor evidence relevance (added analysis, not registered): paths of the decision-quality model through the two relevance factors, by legal context

Path	Illegal abortion		Improper disposal		Equal across contexts
	b (SE)	95% CI	b (SE)	95% CI	
a paths: outcome information → relevance factor					
Expected evidence → Factor 1	−0.176 (0.344)	[−0.851, 0.499]	0.581 (0.324)	[−0.053, 1.216]	No
Unexpected evidence → Factor 1	−0.477 (0.400)	[−1.261, 0.307]	−0.222 (0.380)	[−0.967, 0.522]	No
Expected evidence → Factor 2	−1.478 (0.382)	[−2.227, −0.729]	−1.179 (0.336)	[−1.837, −0.520]	No

Path	Illegal abortion		Improper disposal		Equal across contexts
	b (SE)	95% CI	b (SE)	95% CI	
Unexpected evidence → Factor 2	−0.871 (0.439)	[−1.731, −0.011]	−0.740 (0.414)	[−1.551, 0.071]	No
b paths: relevance factor → pregnancy-evidence likelihood					
Factor 1 → pregnancy-evidence likelihood	5.693 (1.065)	[3.606, 7.781]	5.693 (1.065)	[3.606, 7.781]	Yes
Factor 2 → pregnancy-evidence likelihood	−2.048 (0.743)	[−3.504, −0.592]	−2.048 (0.743)	[−3.504, −0.592]	Yes

Note. Two-factor analysis (added analysis, not registered), the H2a–H2b model (the model E6 reads), registered model with the attitudes, primary sample.

Table 1-S2.19

Two-factor evidence relevance (added analysis, not registered): global fit of the decision-quality model

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
Two-factor analysis (added analysis, not registered)					
Registered model	392.74 (219)	< .001	.929	.064 [.054, .075]	.061
Without attitudes	307.42 (151)	< .001	.914	.075 [.063, .087]	.073
Pooled contexts	408.46 (235)	< .001	.929	.062 [.051, .072]	.063
Pooled contexts, without attitudes	320.60 (163)	< .001	.913	.072 [.060, .084]	.076

Note. Primary sample; E6 reads the same model. The registered model's fits (the ten-item mean) are in Table 1-S4.11.

Table 1-S2.20

Two-factor evidence relevance (added analysis, not registered): serial indirect effects of outcome information on scalar probable cause–confidence, by legal context

Pathway	Letter	Added analysis, not registered			
		Through factor 1	**Through factor 2**	**Estimate [95% CI]**	**Decision**
Illegal abortion					
Expected evidence → relevance → likelihood → scalar probable cause–confidence	H4b	−0.962 [−5.475, 2.454]	2.754 [0.629, 6.448]	1.792 [−2.177, 6.554]	not supported
Unexpected evidence → relevance → likelihood → scalar probable cause–confidence	H4c	−2.480 [−7.946, 1.475]	1.623 [0.001, 4.549]	−0.857 [−5.558, 3.212]	not supported
Expected minus unexpected evidence → relevance → likelihood → scalar probable cause–confidence	H4d	—	—	2.649 [−1.059, 7.838]	not supported
Improper disposal					
Expected evidence → relevance → likelihood → scalar probable cause–confidence	H4b	3.684 [−0.621, 9.081]	2.734 [0.654, 6.359]	6.417 [1.856, 13.058]	supported
Unexpected evidence → relevance → likelihood → scalar probable cause–confidence	H4c	−1.458 [−6.783, 3.511]	1.717 [−0.087, 5.103]	0.259 [−3.870, 5.019]	not supported

Pathway	Letter	Added analysis, not registered			
		Through factor 1	Through factor 2	Estimate [95% CI]	Decision
Expected minus unexpected evidence → relevance → likelihood → scalar probable cause–confidence	H4d	—	—	6.158 [1.813, 11.857]	supported

Note. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported in Table 1-S8.7, unchanged. L is the serial indirect association through evidence reinterpretation and then pregnancy-evidence likelihood, summed over the retained relevance factors (registered model); no per-factor component of the expected-minus-unexpected difference is registered. Units: scalar probable cause–confidence points (–100 to 100) per outcome contrast.

Table 1-S2.21

Two-factor evidence relevance (added analysis, not registered): serial indirect effects of outcome information on the probable-cause ruling, by legal context

Pathway	Letter	Added analysis, not registered			
		Through factor 1	Through factor 2	Estimate [95% CI]	Decision
Illegal abortion					
Expected evidence → relevance → likelihood → probable-cause ruling	E12a	−0.024 [−0.495, 0.358]	0.217 [0.061, 0.638]	0.193 [−0.175, 0.773]	unavailable
Unexpected evidence → relevance → likelihood → probable-cause ruling	E12b	−0.213 [−0.960, 0.170]	0.139 [0.001, 0.472]	−0.074 [−0.656, 0.337]	unavailable
Expected minus unexpected evidence → relevance → likelihood → probable-cause ruling	E12c	—	—	0.267 [−0.071, 0.960]	unavailable
Improper disposal					
Expected evidence → relevance → likelihood → probable-cause ruling	E12a	0.191 [−0.040, 0.884]	0.143 [0.031, 0.561]	0.335 [0.079, 1.293]	unavailable

Pathway	Letter	Added analysis, not registered			
		Through factor 1	Through factor 2	Estimate [95% CI]	Decision
Unexpected evidence → relevance → likelihood → probable-cause ruling	E12b	−0.079 [−0.523, 0.304]	0.088 [−0.007, 0.390]	0.009 [−0.288, 0.437]	unavailable
Expected minus unexpected evidence → relevance → likelihood → probable-cause ruling	E12c	—	—	0.326 [0.079, 1.201]	unavailable

Note. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported in Table 1-S8.8, unchanged. Intervals: participant bootstrap percentiles (type 6), 10,000 attempts, 7,912 usable. Bootstrap estimates from this run were marked unstable because usable attempts fell below the registered minimum of 9,500. Decisions for the two-factor sums were "unavailable"; percentile intervals were descriptive. Units = probit units of the ruling's latent response per outcome contrast. The two-factor run also refitted the registered observed-score companion of E12a–E12c (the ten-item mean). Its point estimates equal the registered ones (largest absolute difference 0). Its intervals use only the attempts in which every version of the two-factor model fitted (7,912 in the primary sample, compared with 9,919 in the registered analysis), so they differ from the registered intervals by up to 0.86.

Expected minus unexpected evidence → severity → foreseeability → confidence	E12d	—	—	0.004 [−0.118, 0.109]

Note. Registered: the ten-item mean, the registered measurement decision; its estimates and decisions are those reported in Table 1-S8.10, unchanged. E12d is registered as estimates without a decision rule. Units: confidence points (0–100) per outcome contrast.

Table 1-S2.23

Two-factor evidence relevance (added analysis, not registered): global fit of the probable cause–confidence and ruling-confidence models, beside the registered ruling-confidence model

Model	Scaled χ^2 (df)	p	Robust CFI	Robust RMSEA [90% CI]	SRMR
H4b–H4d: Two-factor analysis (added analysis, not registered)					
Registered model	380.95 (209)	< .001	.925	.066 [.055, .076]	.065
Without attitudes	300.52 (141)	< .001	.907	.078 [.066, .091]	.079
Pooled contexts	399.14 (223)	< .001	.923	.064 [.054, .075]	.067
Pooled contexts, without attitudes	315.10 (151)	< .001	.904	.077 [.065, .089]	.082
E12d: Two-factor analysis (added analysis, not registered)					
Registered model	350.12 (209)	< .001	.932	.059 [.048, .070]	.059
Without attitudes	266.34 (141)	< .001	.918	.070 [.056, .082]	.068
E12d: Registered (ten-item mean)					
Registered model	27.99 (30)	.571	1.000	.000 [.000, .050]	.028
Without attitudes	21.55 (14)	.088	.972	.054 [.000, .095]	.039

Note. Primary sample. The two-factor models have more observed variables (eight relevance items instead of their mean), so their degrees of freedom and indices are not comparable with the registered models' in size. The registered H4b–H4d model's fits (the ten-item mean) are in Table 1-S4.23.

S3. Manipulation checks and descriptive statistics

Notes shared by tables of this section.

- Tables 1-S3.2 and 1-S3.6: M (SD) over participants with a response; n = responses in the whole primary sample.
- Tables 1-S3.2, 1-S3.3 and 1-S3.6: Per-condition primary n: Illegal abortion, No information 68; Illegal abortion, Expected evidence 63; Illegal abortion, Unexpected evidence 63; Improper disposal, No information 71; Improper disposal, Expected evidence 66; Improper disposal, Unexpected evidence 67.
- Tables 1-S3.9 to 1-S3.11: n per condition from the eligibility records of the data preparation.
- Tables 1-S3.9 to 1-S3.11: Passed, did not pass, and blank come from the recorded checks; a participant who did not pass answered with any other option.
- Tables 1-S3.9 to 1-S3.11: 95% CI = Wilson score interval for the proportion, without continuity correction.
- Tables 1-S3.9 to 1-S3.11: Ab = illegal abortion; Di = improper disposal of human remains; expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.

Table 1-S3.1

Missing responses, skewness and kurtosis of the continuous modeled measures, primary sample

Measure	n	Missing (%)	Skewness	Kurtosis
Pregnancy-evidence likelihood	398	0.0	0.15	−0.86
Financial-crime evidence likelihood	398	0.0	1.18	0.06
Nothing-incriminating likelihood	398	0.0	−0.04	−1.27
Consequence severity	398	0.0	−0.79	0.02
Foreseeability	398	0.0	0.00	−0.95
Evidence relevance (ten-item mean)	398	0.0	−0.84	0.51
Decision quality	398	0.0	−0.12	−1.31
Detective blame	398	0.0	−0.03	−1.53
Consequences for the detective	398	0.0	0.66	−0.84
Wrongness of the detective's decision	398	0.0	0.03	−1.46

Measure	n	Missing (%)	Skewness	Kurtosis
Suspect blame	398	0.0	0.08	−1.34
Probable-cause confidence	398	0.0	−1.10	1.22
Signed probable-cause confidence	398	0.0	−0.05	−1.83
Required certainty, keyword warrant	398	0.0	−1.02	0.47
Required certainty, text-message warrant	398	0.0	−0.99	0.74
Required certainty, home search	398	0.0	−0.97	0.62
Abortion attitudes (total)	398	0.0	0.47	−0.99
Support for punishment	398	0.0	0.18	−0.98
Hostile sexism	398	0.0	0.55	−0.73
Benevolent sexism	398	0.0	−0.18	−0.84

Note. The supplement registers these descriptions and keeps the registered estimators whatever they show. All three are computed with psych::skew() and psych::kurtosi() (type 3; kurtosis is excess kurtosis). Missing = participants without a response over the primary sample.

Table 1-S3.2

Continuous judgments, attitudes and age by condition, primary sample: M (SD)

Variable	Range	Illegal abortion, No information	Illegal abortion, Expected evidence	Illegal abortion, Unexpected evidence	Improper disposal, No information	Improper disposal, Expected evidence	Improper disposal, Unexpected evidence	Total	n

Note. Counts and percentages of the participants who answered each item; no item had a missing response, so the no-response rows are not shown. Rulings and approvals are coded 1 = yes and 0 = no; error preference is coded as the preparation codes it.

Figure 1-S3.1

Correlations among the attitude and background measures

Note. Pearson correlations in the primary sample. Religiosity is the mean of the standardized items. Darker shading marks a larger correlation, and the printed coefficient gives its sign. The figure is descriptive.

Table 1-S3.4

Attitude measures and age by demographic response and by error preference: M (SD), n

Grouping	Response	Abortion attitudes (total)	Support for punishment	Hostile sexism	Benevolent sexism	Religiosity (standardized)	Political ideology	Abortion attitudes in practice (item)	Age

Party	Republican Party	42	66

Note. Cross-tabulation counts over participants who answered both items. Rows by state of residence are not shown; the state counts are in Table 1-S3.3.

Figure 1-S3.2

Attitude measures by outcome condition and legal context

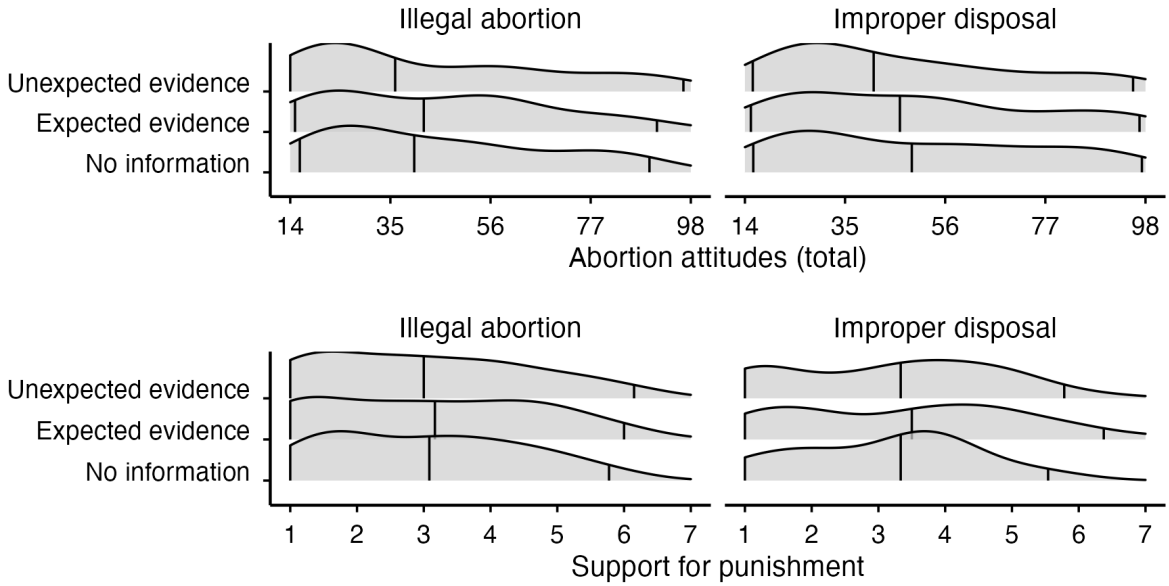

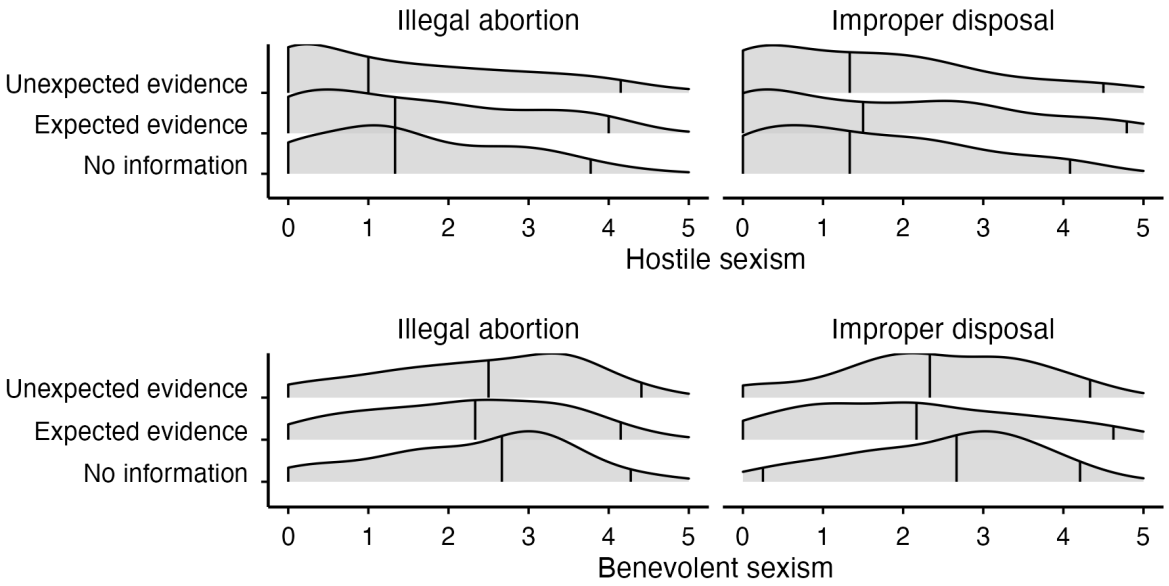

Figure 1-S3.2 (continued)

Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (14 to 98 for abortion attitudes, 1 to 7 for support for punishment, and 0 to 5 for hostile and benevolent sexism). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Table 1-S3.6

Relevance ratings of the ten evidence items by condition, primary sample: M (SD)

Item	Illegal abortion, No information	Illegal abortion, Expected evidence	Illegal abortion, Unexpected evidence	Improper disposal, No information	Improper disposal, Expected evidence	Improper disposal, Unexpected evidence	Total	n
Relevance, item 1	5.37 (2.71)	6.43 (2.37)	5.17 (2.77)	5.32 (2.41)	6.74 (2.59)	5.43 (3.09)	5.74 (2.72)	398
Relevance, item 2	7.03 (2.66)	5.44 (2.82)	6.49 (3.00)	7.17 (1.99)	5.68 (2.74)	6.22 (3.21)	6.36 (2.81)	398
Relevance, item 3	3.18 (2.47)	2.81 (2.40)	2.84 (2.48)	3.21 (2.43)	2.79 (2.44)	3.43 (2.75)	3.05 (2.49)	398
Relevance, item 4	6.75 (2.89)	5.71 (2.73)	6.29 (2.89)	6.04 (2.38)	5.24 (2.78)	6.13 (3.09)	6.03 (2.82)	398
Relevance, item 5	7.18 (2.42)	5.56 (2.62)	6.13 (2.93)	7.01 (2.21)	5.55 (2.77)	6.18 (3.08)	6.29 (2.74)	398
Relevance, item 6	5.87 (2.89)	5.27 (2.71)	5.60 (2.93)	5.58 (2.61)	5.97 (2.45)	5.49 (2.99)	5.63 (2.76)	398
Relevance, item 7	7.22 (2.45)	6.68 (2.48)	6.60 (2.78)	7.37 (2.22)	7.38 (2.51)	6.72 (3.15)	7.01 (2.62)	398

Note. Pearson r on all available pairs across the whole primary sample (not centered within condition), with the registered Fisher 95% interval. The measurement analysis uses correlations centered within condition instead.

Figure 1-S3.3

Relevance ratings of the ten evidence items by outcome condition and legal context

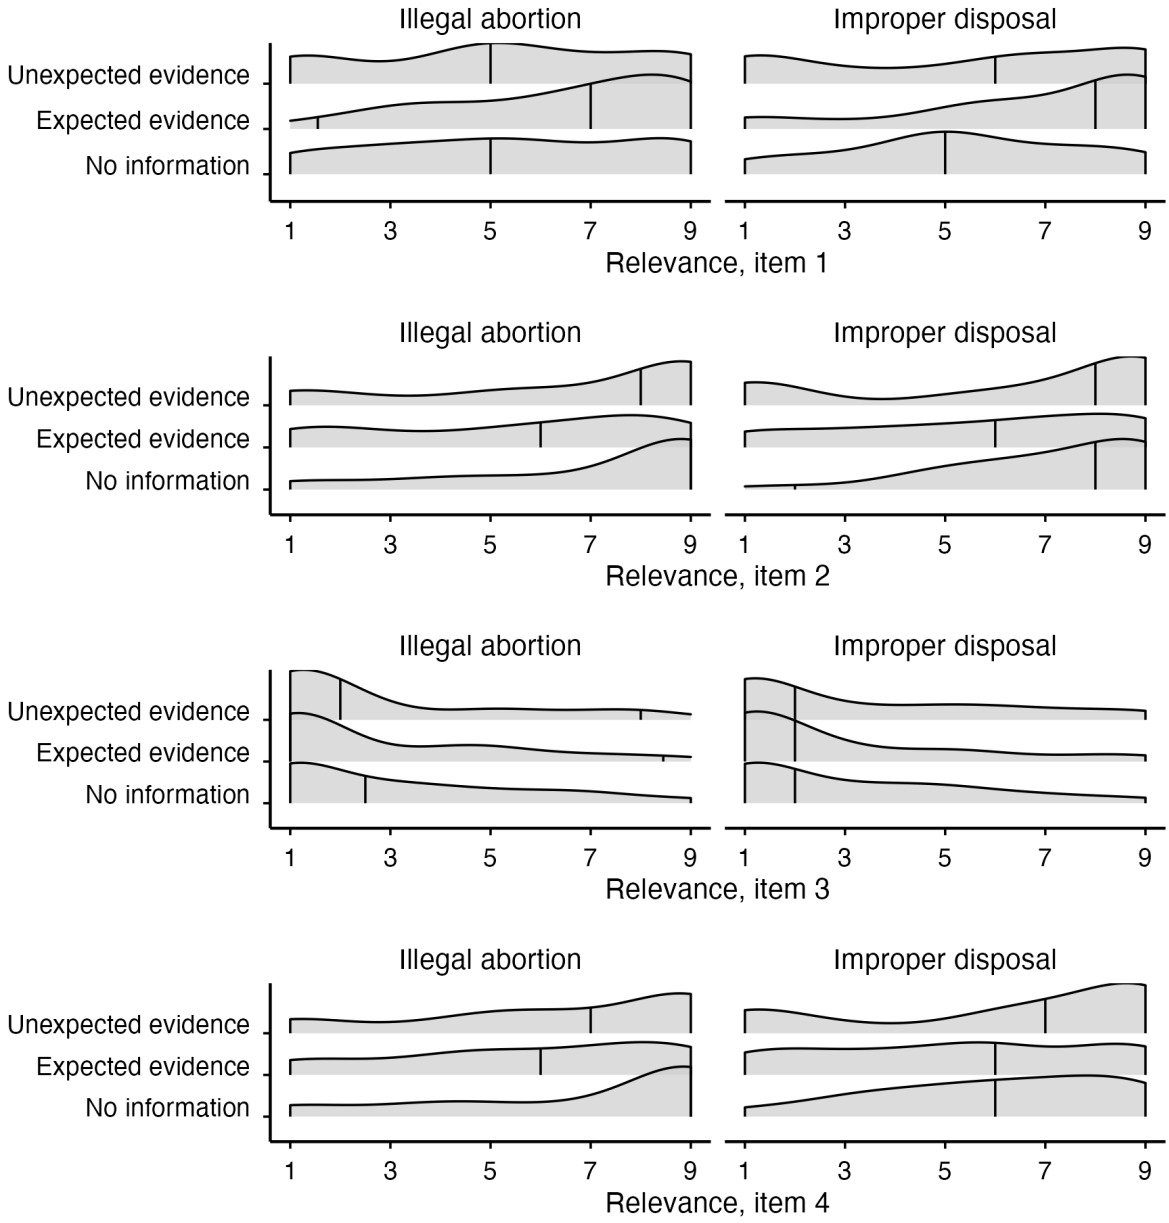

Figure 1-S3.3 (continued)

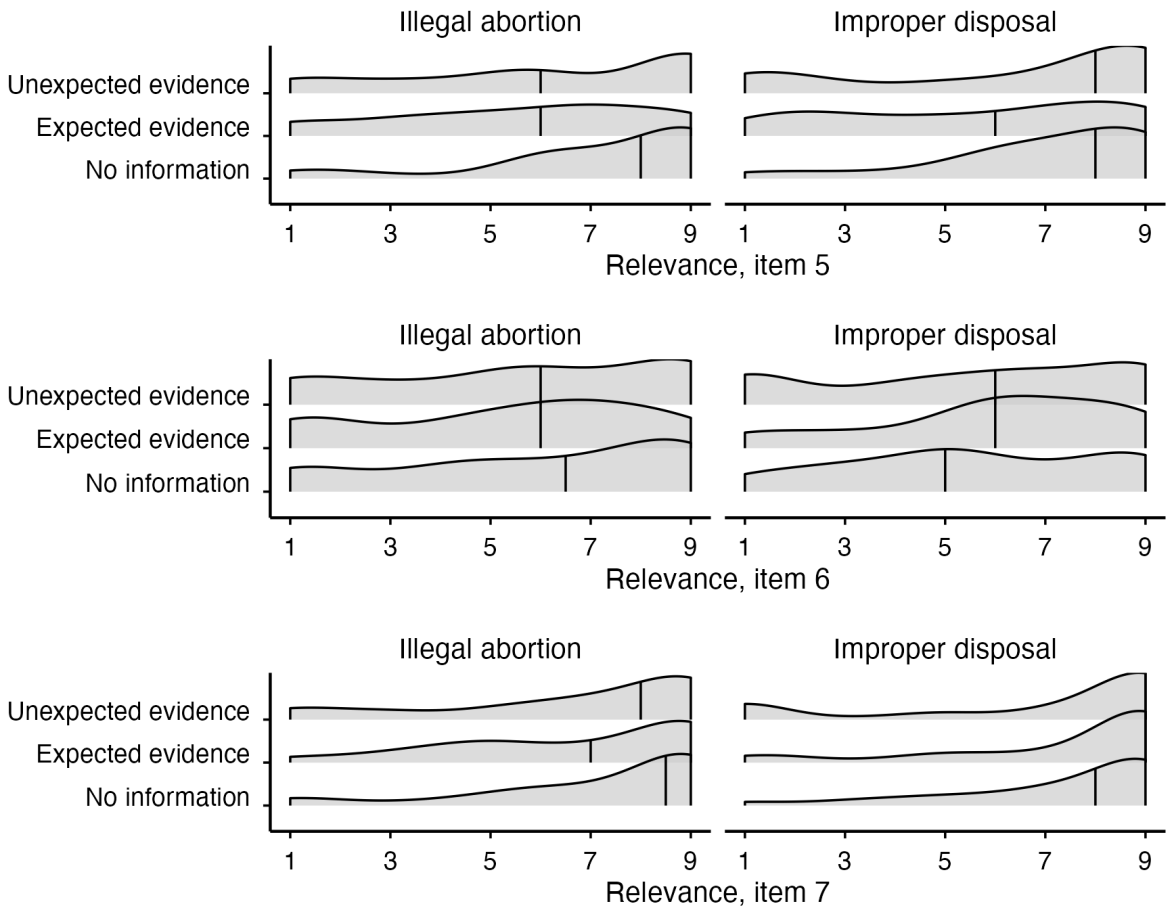

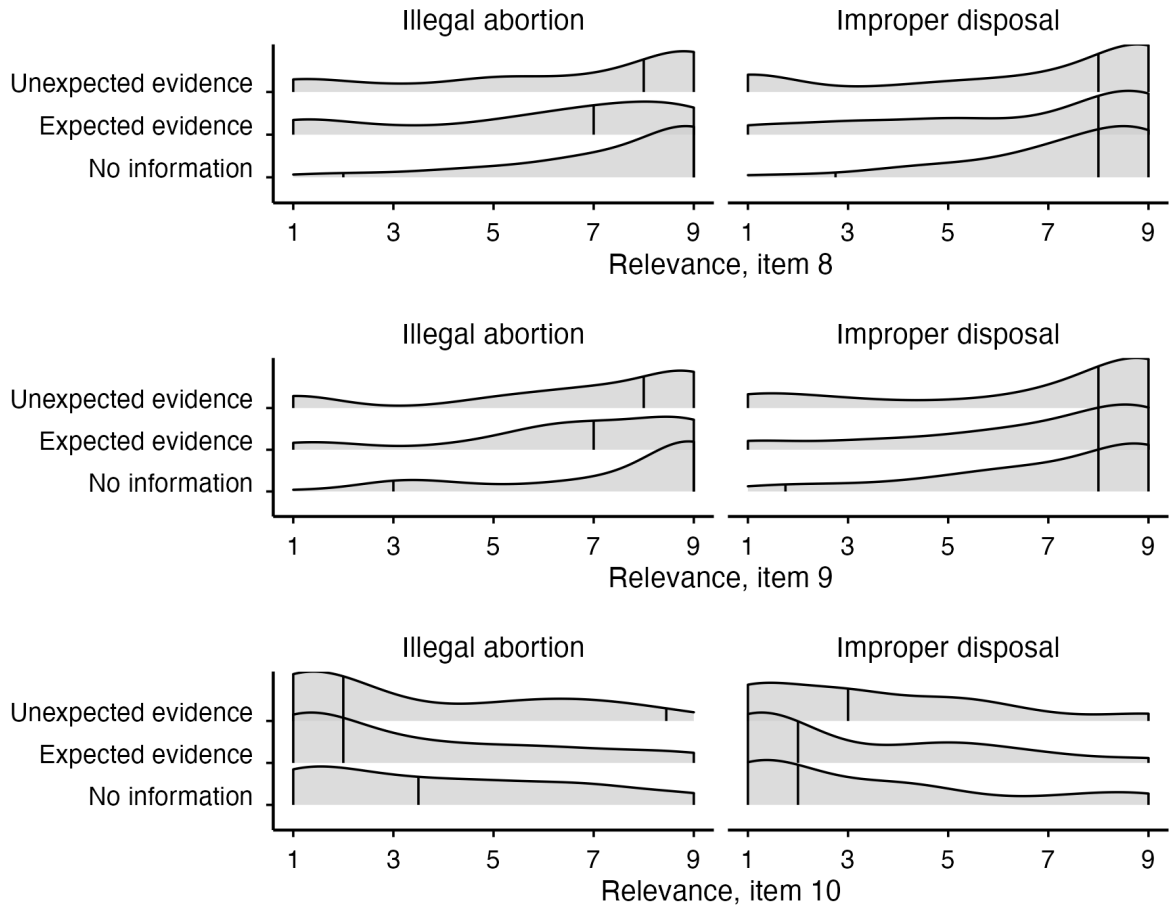

Figure 1-S3.3 (continued)

Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (1 to 9 for each of the ten relevance items). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

Table 1-S3.8

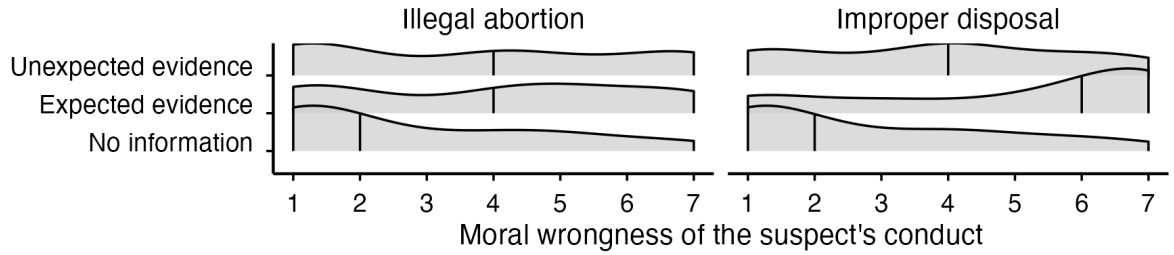

Moral wrongness of the suspect's conduct by condition, primary sample

Condition	n	Missing	M	SD	Mdn	Range
Illegal abortion, No information	68	0	2.88	2.01	2.0	1 to 7
Illegal abortion, Expected evidence	63	0	3.97	2.19	4.0	1 to 7
Illegal abortion, Unexpected evidence	63	0	3.78	2.30	4.0	1 to 7
Improper disposal, No information	71	0	2.86	1.97	2.0	1 to 7
Improper disposal, Expected evidence	66	0	4.88	2.26	6.0	1 to 7
Improper disposal, Unexpected evidence	67	0	3.81	2.03	4.0	1 to 7
Total	398	0	3.68	2.22	4.0	1 to 7

Note. Ratings run from 1 to 7. Reported descriptively, without a significance decision, as registered.

Figure 1-S3.4

Moral wrongness of the suspect's conduct by outcome condition and legal context

Note. Density plots of the primary sample's responses by outcome condition, with one panel for each legal context. Lines mark the 2.5th, 50th, and 97.5th percentiles. No information is the foresight condition. Expected evidence is the HACE condition, and unexpected evidence is the HUCE condition. Each density is drawn only within the range of its scale (1 to 7). The figure is descriptive and includes no test. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence.

The registered legal-context rule is read in Table 1-S3.9, whose Note gives its threshold and verdicts.

Table 1-S3.9

Legal-context check: participants choosing the statute their warrant cited

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
Primary	Illegal abortion	194	168	26	16	0	86.6	[81.1, 90.7]
	Improper disposal	204	171	33	8	0	83.8	[78.2, 88.2]
	Ab, no information	68	57	11	7	0	83.8	[73.3, 90.7]
	Ab, expected evidence	63	59	4	2	0	93.7	[84.8, 97.5]
	Ab, unexpected evidence	63	52	11	7	0	82.5	[71.4, 90.0]
	Di, no information	71	60	11	4	0	84.5	[74.3, 91.1]
	Di, expected evidence	66	55	11	2	0	83.3	[72.6, 90.4]
	Di, unexpected evidence	67	56	11	2	0	83.6	[72.9, 90.6]
	All conditions	398	339	59	24	0	85.2	[81.3, 88.3]
Survey responses	Illegal abortion	212	181	31	17	0	85.4	[80.0, 89.5]
	Improper disposal	230	190	40	11	0	82.6	[77.2, 87.0]
	Ab, no information	75	60	15	8	0	80.0	[69.6, 87.5]
	Ab, expected evidence	69	65	4	2	0	94.2	[86.0, 97.7]

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
	Ab, unexpected evidence	68	56	12	7	0	82.4	[71.6, 89.6]
	Di, no information	78	65	13	4	0	83.3	[73.5, 90.0]
	Di, expected evidence	77	63	14	4	0	81.8	[71.8, 88.8]
	Di, unexpected evidence	75	62	13	3	0	82.7	[72.6, 89.6]
	All conditions	442	371	71	28	0	83.9	[80.2, 87.1]

Note. The “Of which, cannot recall” column counts “I cannot recall which statute was cited” responses, not identification of the statute. Rate is passed / n. The Primary Illegal abortion and Improper disposal rows supply the registered legal-context decision. Registered threshold: 60%, read from the quoted supplement sentence. In the primary sample, illegal abortion (86.6%) and improper disposal (83.8%) are at or above it. Primary estimates: grouped.

Table 1-S3.10

Outcome check: participants identifying what the search revealed

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
Primary	No information	139	94	45	17	0	67.6	[59.5, 74.8]
	Expected evidence	129	116	13	2	0	89.9	[83.5, 94.0]
	Unexpected evidence	130	107	23	5	0	82.3	[74.8, 87.9]

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
	Ab, no information	68	47	21	8	0	69.1	[57.4, 78.8]
	Ab, expected evidence	63	55	8	1	0	87.3	[76.9, 93.4]
	Ab, unexpected evidence	63	51	12	3	0	81.0	[69.6, 88.8]
	Di, no information	71	47	24	9	0	66.2	[54.6, 76.1]
	Di, expected evidence	66	61	5	1	0	92.4	[83.5, 96.7]
	Di, unexpected evidence	67	56	11	2	0	83.6	[72.9, 90.6]
	All conditions	398	317	81	24	0	79.6	[75.4, 83.3]
Survey responses	No information	153	103	50	19	0	67.3	[59.5, 74.2]
	Expected evidence	146	133	13	2	0	91.1	[85.4, 94.7]
	Unexpected evidence	143	118	25	5	0	82.5	[75.5, 87.9]
	Ab, no information	75	53	22	8	0	70.7	[59.6, 79.8]
	Ab, expected evidence	69	61	8	1	0	88.4	[78.8, 94.0]
	Ab, unexpected evidence	68	55	13	3	0	80.9	[70.0, 88.5]
	Di, no information	78	50	28	11	0	64.1	[53.0, 73.9]

Sample	Condition	n	Passed	Did not pass	Of which, cannot recall	Blank	Rate (%)	95% CI
	Di, expected evidence	77	72	5	1	0	93.5	[85.7, 97.2]
	Di, unexpected evidence	75	63	12	2	0	84.0	[74.1, 90.6]
	All conditions	442	354	88	26	0	80.1	[76.1, 83.5]

Note. Rate = passed / n. “Of which, cannot recall” counts the answer “I cannot recall what the search revealed”, which is not a failure for the sensitivity sample.

Participants choosing the instructed answer on attention checks 1, 2 and 3 (all conditions): in the primary sample, 397 of 398, 397 of 398 and 398 of 398; among the survey responses, 441 of 442, 441 of 442 and 442 of 442. Every other answer was in the improper disposal, expected evidence condition; no answer was blank. Every item answered as instructed: 397 of 398 primary-sample members and 441 of 442 survey responses.

Table 1-S3.11

Comprehension check: participants marking the two true statements and leaving the false one unmarked

Sample	Condition	n	Passed	Did not pass	Blank	Rate (%)	95% CI
Primary	Ab, no information	68	58	10	0	85.3	[75.0, 91.8]
	Ab, expected evidence	63	47	16	0	74.6	[62.7, 83.7]
	Ab, unexpected evidence	63	50	13	0	79.4	[67.8, 87.5]
	Di, no information	71	57	14	0	80.3	[69.6, 87.9]

Sample	Condition	n	Passed	Did not pass	Blank	Rate (%)	95% CI
	Di, expected evidence	66	55	11	0	83.3	[72.6, 90.4]
	Di, unexpected evidence	67	51	16	0	76.1	[64.7, 84.7]
	All conditions	398	318	80	0	79.9	[75.7, 83.5]
Survey responses	Ab, no information	75	63	12	0	84.0	[74.1, 90.6]
	Ab, expected evidence	69	51	18	0	73.9	[62.5, 82.8]
	Ab, unexpected evidence	68	53	15	0	77.9	[66.7, 86.2]
	Di, no information	78	61	17	0	78.2	[67.8, 85.9]
	Di, expected evidence	77	65	12	0	84.4	[74.7, 90.9]
	Di, unexpected evidence	75	57	18	0	76.0	[65.2, 84.2]
	All conditions	442	350	92	0	79.2	[75.2, 82.7]

Note. Rate = passed / n. A check with no statement marked is recorded as blank, because the data cannot distinguish an omission from marking none.

S4. Full results of the manuscript's models

Notes shared by tables of this section.

- Tables 1-S4.1 and 1-S4.11: Scaled (Satorra–Bentler) chi-square with its p; robust CFI; robust RMSEA with its 90% interval; SRMR, as registered for the over-identified model.
- Tables 1-S4.1, 1-S4.11 and 1-S4.23: Global fit is reported and changes no model.
- Tables 1-S4.1, 1-S4.2, 1-S4.11 and 1-S4.23: RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).
- Tables 1-S4.3 and 1-S4.12: The coefficients retain the variables' original units. I report robust (Huber–White) standard errors, two-sided normal Wald 95% intervals, and two-sided p values.
- Tables 1-S4.3, 1-S4.12 and 1-S4.24: Paths marked equal across contexts are one shared parameter.
- Tables 1-S4.3, 1-S4.5, 1-S4.24 and 1-S4.25: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information.
- Tables 1-S4.3 to 1-S4.6, 1-S4.9, 1-S4.10, 1-S4.12, 1-S4.13, 1-S4.15, 1-S4.18, 1-S4.19, 1-S4.22, 1-S4.24 and 1-S4.25: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).
- Tables 1-S4.3, 1-S4.12 and 1-S4.24: β = the standardized estimate (std.all) of the same path; inference and decisions use the unstandardized estimates.
- Tables 1-S4.5 and 1-S4.25: The pooled estimates: every path constrained to be equal across the two legal contexts (the registered secondary analysis when both contexts pass the legal-context rule).
- Tables 1-S4.6 and 1-S4.15: Each entry is the condition mean with its two-sided 95% Student t interval, from the saved model's coefficients and covariance on its residual degrees of freedom: with the attitudes, the mean at the attitude means of the participants in the model; without them, the condition mean.
- Tables 1-S4.6 and 1-S4.8 to 1-S4.10: Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale.
- Tables 1-S4.6, 1-S4.9, 1-S4.10, 1-S4.12, 1-S4.13, 1-S4.15, 1-S4.18, 1-S4.19 and 1-S4.22: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.
- Tables 1-S4.7, 1-S4.16 and 1-S4.20: Analysis of Covariance (ANCOVA) with the four attitudes as covariates.

- Tables 1-S4.7, 1-S4.16 and 1-S4.20: Partial η^2 = partial eta-squared (η^2_p) with its 90% CI (noncentral F).
- Tables 1-S4.7, 1-S4.16 and 1-S4.20: Adjusted means estimated at covariate mean(s) via emmeans.
- Tables 1-S4.7 and 1-S4.16: The bands with the attitudes are the analyses of covariance.
- Tables 1-S4.7 and 1-S4.16: The bands without attitudes are the analyses of variance without covariates.
- Tables 1-S4.7 and 1-S4.20: The registered tests are the comparisons, not these F tests.
- Tables 1-S4.8 and 1-S4.17: Unstandardized slopes of the four attitudes, common to the six conditions, from the saved models with attitudes: judgment points per attitude scale point, with Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom.
- Tables 1-S4.9 and 1-S4.10: Differences of adjusted condition means with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of each model; no adjustment for multiple comparisons.
- Tables 1-S4.9 and 1-S4.18: The models carry the six conditions and no covariate.
- Tables 1-S4.9 and 1-S4.18: Reported beside the registered models; decisions are read from the models with attitudes only.
- Tables 1-S4.15, 1-S4.17 and 1-S4.18: Decision quality is in points on the 1–7 scale; detective blame, deserved consequences and wrongness are in points on their 0–10 scales.
- Tables 1-S4.19 and 1-S4.22: Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points.

Table 1-S4.1

Global fit of the four saved versions of the H1 model

Model	χ^2	df	p	CFI	RMSEA	RMSEA 90% CI	SRMR
Registered model	23.31	26	.616	1.000	.000	[.000, .049]	.027
Without attitudes	16.07	10	.098	.978	.056	[.000, .103]	.038
Pooled contexts	31.15	30	.408	.999	.012	[.000, .056]	.034
Pooled contexts, without attitudes	24.11	14	.044	.963	.060	[.010, .100]	.050

Table 1-S4.2

The registered H1 equality test: the registered model against the model with every H1 path free by legal context

Model	χ^2	df	p	CFI	RMSEA	SRMR
Every H1 path free by legal context	8.41	4	.078	.994	.074 [.000, .146]	.018
Scaled difference	14.88	22	.867	—	—	—

Note. Satorra–Bentler (2010) scaled chi-square difference on the registered df (22 here, the analysis's expected df 22). Not rejected: the registered common-path model stands; no sensitivity products are reported. RMSEA with its 90% interval in brackets; CFI and RMSEA robust. Support for H1a–H1d is read from the registered model either way. When this comparison was estimated, lavaan warned that the covariance matrix of the parameter estimates was not positive definite, which can signal an unidentified model; its smallest eigenvalue, –1.825270e-18, is zero to numerical precision. The registered model (shared paths) is the Registered model row of Table 1-S4.1.

Table 1-S4.3

Unstandardized (b) and standardized (β) path estimates of the registered H1 model, by legal context

Predictor	Illegal abortion				Improper disposal				Equal across contexts
	b (SE)	95% CI	p	β	b (SE)	95% CI	p	β

Table 1-S4.4

Variance explained in each equation of the registered H1 model, H2a–H2b model and serial pathway model, by legal context

Equation	H1 model		H2a–H2b model		Serial pathway model	
	Illegal abortion	**Improper disposal**	**Illegal abortion**	**Improper disposal**	**Illegal abortion**	**Improper disposal**
Evidence relevance	.072	.038	.072	.038	.072	.038
Consequence severity	.029	.088	.029	.088	.029	.088
Pregnancy-evidence likelihood	.163	.185	.163	.185	.163	.185
Foreseeability	.098	.108	.098	.108	.098	.108
Decision quality	—	—	.516	.552	—	—
Scalar probable cause–confidence	—	—	—	—	.330	.467

Note. R^2 of each endogenous variable from the fitted model. R^2 does not depend on the fitting scale. — marks an equation the model does not have.

Table 1-S4.5

Indirect effects of the secondary set of the registered legal-context rule, with and without the attitudes

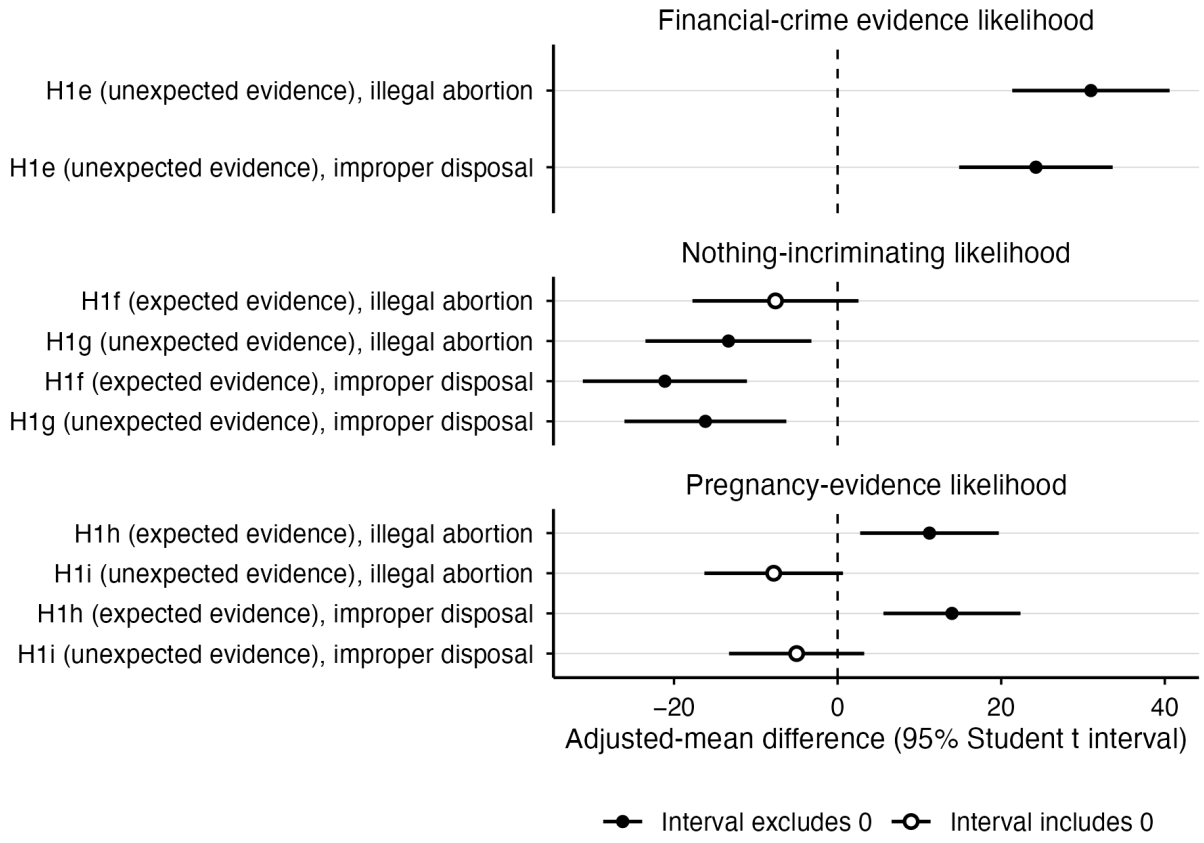

Pathway	Letter	Estimate	95% CI	Predicted
Pooled contexts				
Expected evidence → evidence relevance → pregnancy-evidence likelihood	H1a	−1.190	[−2.397, −0.321]	Positive
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	H1b	−1.049	[−2.363, −0.099]	Negative
Expected evidence → consequence severity → foreseeability	H1c	0.003	[−0.021, 0.026]	Positive

Pathway	Letter	Estimate	95% CI	Predicted
Unexpected evidence → consequence severity → foreseeability	H1d	−0.001	[−0.017, 0.012]	Positive
Pooled contexts, without attitudes				
Expected evidence → evidence relevance → pregnancy-evidence likelihood	H1a	−1.299	[−2.577, −0.364]	Positive
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	H1b	−1.109	[−2.465, −0.080]	Negative
Expected evidence → consequence severity → foreseeability	H1c	0.007	[−0.016, 0.032]	Positive
Unexpected evidence → consequence severity → foreseeability	H1d	−0.002	[−0.021, 0.011]	Positive

Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-outcome paths, in pregnancy-evidence likelihood points or foreseeability scale points per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Global fit: Table 1-S4.1 (pooled contexts; pooled contexts, without attitudes).

Figure 1-S4.1

Registered comparisons of the likelihood judgments with their Student t intervals

Note. I adjusted the primary-sample mean differences for the four attitudes. I used no information as the reference, except for rows comparing expected with unexpected evidence. Filled circles mark intervals that exclude zero and open circles mark those that include zero; the two-sided 95% Student *t* intervals use residual degrees of freedom. The table gives the decisions. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S4.6

Condition means of the six judgments from the saved models, with and without the attitudes

Judgment	Illegal abortion			Improper disposal		
	No information	**Expected evidence**	**Unexpected evidence**	**No information**	**Expected evidence**	**Unexpected evidence**
With the four attitudes (registered)						
Financial-crime evidence likelihood	16.72 [10.05, 23.40]	14.77 [7.83, 21.71]	47.69 [40.75, 54.64]	18.14 [11.58, 24.70]	16.82 [9.98, 23.66]	42.38 [35.66, 49.11]
Nothing-incriminating likelihood	58.46 [51.42, 65.49]	50.86 [43.54, 58.18]	45.11 [37.78, 52.44]	55.84 [48.92, 62.76]	34.72 [27.50, 41.94]	39.67 [32.58, 46.76]
Pregnancy-evidence likelihood	40.30 [34.42, 46.17]	51.53 [45.42, 57.64]	32.48 [26.37, 38.60]	43.33 [37.55, 49.10]	57.31 [51.28, 63.33]	38.31 [32.39, 44.24]
Abortion-evidence likelihood	28.89 [22.45, 35.33]	54.68 [47.99, 61.38]	31.38 [24.68, 38.09]	32.80 [26.47, 39.13]	50.77 [44.17, 57.37]	31.75 [25.26, 38.24]
Disposal-evidence likelihood	51.70 [44.58, 58.82]	48.38 [40.98, 55.78]	33.58 [26.17, 41.00]	53.85 [46.85, 60.85]	63.84 [56.54, 71.14]	44.88 [37.70, 52.05]
Foreseeability	2.533 [2.316, 2.750]	2.926 [2.700, 3.152]	2.369 [2.143, 2.595]	2.884 [2.671, 3.098]	3.077 [2.854, 3.300]	2.512 [2.293, 2.731]
Without attitudes						
Financial-crime evidence likelihood	16.04 [9.16, 22.92]	14.52 [7.38, 21.67]	46.90 [39.76, 54.05]	18.27 [11.53, 25.00]	18.30 [11.32, 25.29]	42.45 [35.52, 49.38]
Nothing-incriminating likelihood	59.35 [52.03, 66.68]	51.16 [43.55, 58.77]	45.87 [38.27, 53.48]	55.77 [48.61, 62.94]	33.12 [25.69, 40.55]	39.40 [32.03, 46.78]
Pregnancy-evidence likelihood	39.69 [33.64, 45.74]	51.27 [44.98, 57.56]	31.95 [25.66, 38.24]	43.40 [37.48, 49.33]	58.41 [52.26, 64.55]	38.51 [32.41, 44.61]
Abortion-evidence likelihood	28.12 [21.45, 34.79]	54.35 [47.42, 61.28]	30.46 [23.53, 37.39]	33.20 [26.67, 39.72]	52.32 [45.55, 59.09]	31.78 [25.06, 38.49]

Judgment	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
Disposal-evidence likelihood	51.26 [44.02, 58.51]	48.19 [40.66, 55.72]	33.44 [25.92, 40.97]	53.61 [46.51, 60.70]	64.50 [57.15, 71.85]	45.24 [37.94, 52.54]
Foreseeability	2.518 [2.297, 2.739]	2.921 [2.691, 3.150]	2.357 [2.128, 2.587]	2.880 [2.664, 3.097]	3.106 [2.882, 3.330]	2.519 [2.296, 2.741]

Note. Each saved comparison is a difference of these means.

Nothing-incriminating likelihood: expected evidence – no information	H1f	Negative	−15.42	3.76	−4.11	392	< .001	[−22.81, −8.04]
Nothing-incriminating likelihood: unexpected evidence – no information	H1g	Negative	−14.93	3.75	−3.98	392	< .001	[−22.30, −7.56]
Pregnancy-evidence likelihood: expected evidence – no information	H1h	Positive	13.29	3.10	4.28	392	< .001	[7.19, 19.40]

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI
Pregnancy-evidence likelihood: unexpected evidence – no information	H1i	Negative	−6.32	3.10	−2.04	392	.042	[−12.41, −0.22]

Note. For these pooled comparisons, I gave the two legal contexts equal weight while retaining the Outcome × Legal Context interaction. This is the registered secondary analysis when both contexts pass the legal-context rule. A letter identifies the hypothesis a comparison would address under that rule; none receives a support decision from this set.

Table 1-S4.11

Global fit of the four saved versions of the H2a–H2b model

Model	χ^2	df	p	CFI	RMSEA	RMSEA 90% CI	SRMR
Registered model	26.85	28	.527	1.000	.000	[.000, .052]	.026
Without attitudes	20.47	12	.059	.985	.059	[.000, .102]	.037
Pooled contexts	41.63	42	.487	1.000	.000	[.000, .048]	.034
Pooled contexts, without attitudes	32.82	22	.064	.980	.051	[.000, .085]	.048

Note. E6 estimates the same model. Its registered and no-attitudes versions therefore have the same saved global fit as the corresponding versions reported here.

Table 1-S4.12

Unstandardized (b) and standardized (β) path estimates of the registered H2a–H2b model, by legal context

Predictor	Illegal abortion				Improper disposal				Equal across contexts
	b (SE)	95% CI	p	β	b (SE)	95% CI	p	β	
Predicting decision quality									
Expected evidence	−0.031 (0.229)	[−0.480, 0.418]	.893	−0.008	0.414 (0.216)	[−0.010, 0.839]	.055	0.106	No

Predictor	Illegal abortion				Improper disposal				Equal across contexts
	b (SE)	95% CI	p	β	b (SE)	95% CI	p	β	
Benevolent sexism	−0.053 (0.095)	[−0.239, 0.134]	.581	−0.033	−0.099 (0.090)	[−0.276, 0.077]	.271	−0.067	No

Note. Table 1-S4.3 reports the equations for evidence relevance, consequence severity, pregnancy-evidence likelihood, and foreseeability, together with their disturbance covariances. Those equations and covariances are identical here, cell for cell.

Table 1-S4.13

Likelihood and foreseeability coefficients of the registered companions: without attitudes and the secondary set of the legal-context rule

Coefficient	Letter	b	SE	z	p	95% CI	Predicted
Without attitudes, illegal abortion							
Pregnancy-evidence likelihood → decision quality	H2a	0.026	0.005	5.45	< .001	[0.016, 0.035]	Positive
Foreseeability → decision quality	H2b	0.565	0.134	4.21	< .001	[0.302, 0.828]	Positive
Without attitudes, improper disposal							
Pregnancy-evidence likelihood → decision quality	H2a	0.028	0.005	5.18	< .001	[0.017, 0.039]	Positive
Foreseeability → decision quality	H2b	0.499	0.126	3.97	< .001	[0.253, 0.746]	Positive
Pooled contexts							
Pregnancy-evidence likelihood → decision quality	H2a	0.023	0.003	6.92	< .001	[0.017, 0.030]	Positive
Foreseeability → decision quality	H2b	0.481	0.087	5.52	< .001	[0.310, 0.652]	Positive
Pooled contexts, without attitudes							
Pregnancy-evidence likelihood → decision quality	H2a	0.027	0.004	7.30	< .001	[0.019, 0.034]	Positive

Coefficient	Letter	b	SE	z	p	95% CI	Predicted
Foreseeability → decision quality	H2b	0.526	0.092	5.71	< .001	[0.346, 0.707]	Positive

Note. The unstandardized coefficients describe decision quality on its 1–7 scale per point of pregnancy-evidence likelihood (0–100) or foreseeability (1–5). The primary set's registered model determines the decisions. The registered secondary analysis pools the legal contexts only when both pass the legal-context rule, constraining every path to equality. Its original-unit path coefficients have robust (Huber–White) standard errors, z tests, and two-sided normal Wald 95% intervals. Those path intervals use the coefficient covariance rather than resampling. Global fit: Table 1-S4.11 (without attitudes; pooled contexts; pooled contexts, without attitudes).

Table 1-S4.14

Omnibus tests of the three context-averaged outcome means of each judgment, with and without the attitudes

Judgment	F	df	p	Partial η²	90% CI
With the four attitudes (registered)					
Decision quality	6.79	2, 388	.001	.034	[.01, 1.00]
Detective blame	2.99	2, 388	.052	.015	[.002, 1.00]
Consequences for the detective	3.20	2, 388	.042	.016	[.002, 1.00]
Wrongness of the detective's decision	4.34	2, 388	.014	.022	[.01, 1.00]
Without attitudes					
Decision quality	7.45	2, 392	< .001	.037	[.01, 1.00]
Detective blame	3.84	2, 392	.022	.019	[.004, 1.00]
Consequences for the detective	3.51	2, 392	.031	.018	[.003, 1.00]
Wrongness of the detective's decision	5.15	2, 392	.006	.026	[.01, 1.00]

Note. The registered omnibus tests equality of the three outcome means, weighting the legal contexts equally. Its model-based F uses two numerator degrees of freedom and the model's residual degrees of freedom; the adjacent planned comparisons determine support for the lettered hypotheses. From the saved F, effectsize supplies partial η^2 and a one-sided 90% interval with upper limit 1.

Table 1-S4.15

Condition means of the four judgments from the saved models, with and without the attitudes

Judgment	Illegal abortion			Improper disposal		
	No information	**Expected evidence**	**Unexpected evidence**	**No information**	**Expected evidence**	**Unexpected evidence**
With the four attitudes (registered)						
Decision quality	3.75 [3.36, 4.14]	4.19 [3.78, 4.59]	4.06 [3.66, 4.47]	3.85 [3.47, 4.24]	4.82 [4.42, 5.22]	3.79 [3.40, 4.18]
Detective blame	5.32 [4.46, 6.18]	4.68 [3.79, 5.58]	4.81 [3.92, 5.71]	5.29 [4.44, 6.13]	3.83 [2.95, 4.72]	5.32 [4.45, 6.18]
Consequences for the detective	3.34 [2.60, 4.09]	3.00 [2.23, 3.78]	2.85 [2.07, 3.62]	3.76 [3.02, 4.49]	2.15 [1.39, 2.91]	3.43 [2.68, 4.18]
Wrongness of the detective's decision	5.14 [4.33, 5.94]	4.44 [3.61, 5.28]	4.98 [4.14, 5.82]	5.23 [4.44, 6.02]	3.57 [2.75, 4.39]	4.86 [4.06, 5.67]
Without attitudes						
Decision quality	3.67 [3.24, 4.11]	4.16 [3.71, 4.62]	3.97 [3.52, 4.43]	3.86 [3.43, 4.29]	4.99 [4.55, 5.44]	3.79 [3.35, 4.24]
Detective blame	5.44 [4.54, 6.34]	4.71 [3.78, 5.65]	4.95 [4.02, 5.89]	5.27 [4.39, 6.15]	3.58 [2.66, 4.49]	5.31 [4.41, 6.22]
Consequences for the detective	3.43 [2.66, 4.19]	3.05 [2.25, 3.84]	2.95 [2.16, 3.75]	3.68 [2.93, 4.42]	2.00 [1.22, 2.78]	3.43 [2.66, 4.20]
Wrongness of the detective's decision	5.26 [4.40, 6.13]	4.49 [3.60, 5.39]	5.14 [4.25, 6.04]	5.18 [4.34, 6.03]	3.29 [2.41, 4.16]	4.87 [4.00, 5.73]

Note. Each saved comparison is a difference of these means, averaged over the legal contexts or taken between them.

Wrongness of the detective's decision, abortion minus disposal								
Expected evidence – no information	—	None	1.12	0.88	1.27	392	.205	[−0.62, 2.86]
Unexpected evidence – no information	—	None	0.20	0.88	0.22	392	.825	[−1.54, 1.93]
Expected evidence – unexpected evidence	—	None	0.93	0.90	1.03	392	.303	[−0.84, 2.69]

Note. These comparisons come from the six-condition models without the attitudes or other covariates. Unadjusted Student t tests and two-sided 95% Student t intervals use the model's residual degrees of freedom. Each difference also has its standard error. Abortion-minus-disposal compares the two contexts' outcome differences; these rows receive no verdict. Registered decisions use the models with attitudes.

Table 1-S4.19

Blame condition means with and without attitude adjustment

Model	Illegal abortion			Improper disposal		
	No information	**Expected evidence**	**Unexpected evidence**	**No information**	**Expected evidence**	**Unexpected evidence**
With the four attitudes (registered)	3.02 [2.60, 3.44]	4.83 [4.39, 5.27]	3.18 [2.75, 3.62]	3.03 [2.62, 3.45]	5.20 [4.77, 5.63]	3.71 [3.29, 4.13]
Without attitudes	2.94 [2.48, 3.40]	4.79 [4.32, 5.27]	3.10 [2.62, 3.57]	3.07 [2.62, 3.52]	5.35 [4.88, 5.82]	3.72 [3.25, 4.18]

Note. CI = confidence interval. Adjusted means were evaluated at the four attitude means among model participants; unadjusted means are the six fitted condition means without covariates. Two-sided 95% Student t CIs use each model's coefficient covariance matrix and residual degrees of freedom. Outcome comparisons give equal weight to the two within-context mean differences.

Table 1-S4.20

Source tables of the analysis of covariance of blame, with and without the attitudes

Source	F	df1	df2	p	Partial η²	90% CI
With the four attitudes (registered)						
Legal context	2.80	1	388	.095	.007	[.000, 1.000]
Outcome information	45.51	2	388	< .001	.190	[.145, 1.000]
Legal context × outcome information	0.74	2	388	.475	.004	[.000, 1.000]
Without attitudes						
Legal context	4.90	1	392	.027	.012	[.002, 1.000]
Outcome information	42.67	2	392	< .001	.179	[.135, 1.000]
Legal context × outcome information	0.65	2	392	.523	.003	[.000, 1.000]

Note. Type-II F-tests. The band with the attitudes is the analysis of covariance. The band without attitudes is the analysis of variance without covariates. Each attitude's one-df F equals the square of its t in Table 1-S4.21, so printing it again would repeat the same test.

Table 1-S4.21

Attitude slopes of the analysis of covariance of blame

Attitude	b	SE	t	df	p	95% CI
Abortion attitudes	0.017	0.005	3.74	388	< .001	[0.008, 0.026]
Support for punishment	0.348	0.073	4.76	388	< .001	[0.204, 0.492]
Hostile sexism	−0.015	0.086	−0.17	388	.866	[−0.185, 0.155]
Benevolent sexism	−0.046	0.088	−0.52	388	.605	[−0.219, 0.127]

Note. A slope gives blame points per attitude scale point, common across the adjusted model's six conditions. Its t test and two-sided 95% Student t interval use residual degrees of freedom.

Table 1-S4.22

Comparisons of blame without the attitudes (registered companion)

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI
Expected evidence – no information	H3a	Positive	2.07	0.24	8.76	392	< .001	[1.60, 2.53]
Unexpected evidence – no information	—	None	0.40	0.24	1.70	392	.090	[−0.06, 0.86]
Expected evidence – unexpected evidence	H3b	Positive	1.67	0.24	6.95	392	< .001	[1.19, 2.14]

Note. SE = standard error; CI = confidence interval. Differences average each outcome contrast across the two legal contexts with equal weight. The six-condition model included no covariates. Student t tests and two-sided 95% Student t CIs use the model's residual degrees of freedom; p values are unadjusted for multiple comparisons. Registered support decisions use the model with attitudes.

Table 1-S4.23

Global Fit of Four Specifications of the Serial Pathway Model

Model	χ^2	df	p	CFI	RMSEA	RMSEA 90% CI	SRMR
Registered model	33.71	30	.293	.996	.025	[.000, .062]	.031
Without attitudes	25.36	14	.031	.973	.066	[.021, .106]	.046
Pooled contexts	50.56	42	.171	.991	.032	[.000, .061]	.040
Pooled contexts, without attitudes	39.13	22	.014	.960	.064	[.029, .096]	.059

Note. χ^2 = Yuan–Bentler scaled chi-square statistic; df = degrees of freedom; CFI = comparative fit index; RMSEA = root mean square error of approximation; SRMR = standardized root mean square residual; CI = confidence interval. Robust CFI and RMSEA are reported, with 90% CIs for RMSEA. All four models were overidentified.

Table 1-S4.24

Unstandardized and Standardized Path Estimates for the Registered Serial Pathway Model, by Legal Context

Predictor	Illegal abortion				Improper disposal				Equal across contexts
	b (SE)	95% CI	p	β	b (SE)	95% CI	p	β	
Predicting scalar probable cause–confidence									
Expected evidence	7.860 (11.285)	[−14.258, 29.978]	.486	0.047	26.432 (10.668)	[5.524, 47.340]	.013	0.156	No
Unexpected evidence	31.257 (11.197)	[9.311, 53.202]	.005	0.186	21.113 (10.431)	[0.669, 41.557]	.043	0.125	No
Pregnancy-evidence likelihood	0.910 (0.232)	[0.454, 1.365]	< .001	0.309	1.132 (0.203)	[0.734, 1.530]	< .001	0.370	No
Foreseeability	24.451 (5.628)	[13.421, 35.482]	< .001	0.300	21.290 (5.216)	[11.068, 31.513]	< .001	0.251	No
Abortion attitudes	0.398 (0.250)	[−0.091, 0.888]	.111	0.121	0.551 (0.197)	[0.166, 0.936]	.005	0.175	No
Support for punishment	4.468 (4.079)	[−3.526, 12.463]	.273	0.087	10.000 (3.071)	[3.981, 16.020]	.001	0.192	No
Hostile sexism	−2.386 (4.450)	[−11.108, 6.335]	.592	−0.040	−5.466 (3.653)	[−12.625, 1.693]	.135	−0.095	No

Predictor	Illegal abortion				Improper disposal				Equal across contexts
	b (SE)	95% CI	p	β	b (SE)	95% CI	p	β	
Benevolent sexism	0.963 (5.052)	[−8.938, 10.864]	.849	0.015	−6.944 (3.803)	[−14.398, 0.510]	.068	−0.108	No

Note. b = unstandardized coefficient; β = standardized coefficient; SE = standard error; CI = confidence interval; MLR = robust maximum likelihood estimation. Huber–White SEs, two-sided p values, and two-sided normal Wald 95% CIs concern b in the original units. The evidence-relevance, consequence-severity, pregnancy-evidence-likelihood, and foreseeability equations and disturbance covariances are identical to those in Table 1-S4.3.

Table 1-S4.25

Serial indirect effects of the secondary set of the registered legal-context rule, with and without the attitudes

Quantity	Letter	Estimate	95% CI	Predicted
Pooled contexts				
Expected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4b	−1.219	[−2.662, −0.298]	Positive
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4c	−1.074	[−2.554, −0.118]	Negative
Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4d	−0.144	[−1.336, 0.894]	Positive
Expected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	0.063	[−0.482, 0.592]	None
Expected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	14.356	[7.693, 22.346]	None
Expected evidence → foreseeability → scalar probable cause–confidence	—	6.465	[1.255, 12.592]	None
Unexpected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	−0.022	[−0.386, 0.280]	None
Unexpected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	−5.319	[−12.000, 0.863]	None
Unexpected evidence → foreseeability → scalar probable cause–confidence	—	−6.315	[−11.878, −1.371]	None
Pooled contexts, without attitudes				
Expected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4b	−1.499	[−3.247, −0.385]	Positive

Quantity	Letter	Estimate	95% CI	Predicted
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4c	−1.279	[−2.965, −0.114]	Negative
Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4d	−0.220	[−1.681, 1.044]	Positive
Expected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	0.163	[−0.399, 0.811]	None
Expected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	17.211	[9.835, 25.619]	None
Expected evidence → foreseeability → scalar probable cause–confidence	—	7.351	[1.729, 14.091]	None
Unexpected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	−0.051	[−0.506, 0.275]	None
Unexpected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	−5.765	[−13.100, 1.065]	None
Unexpected evidence → foreseeability → scalar probable cause–confidence	—	−6.462	[−12.350, −1.146]	None

Note. Indirect effects = products of unstandardized paths, in probable cause–confidence points (−100 to 100) per outcome contrast; CI = confidence interval. Two-sided 95% percentile bootstrap CIs used type 6 quantiles from 10,000 participant resamples within the six conditions (all usable). Table 1-S4.23 gives global fit for the pooled-context versions with and without attitudes.

Notes shared by tables of this section.

- Tables 1-S5.1 and 1-S5.3 to 1-S5.6: A letter is supported in a legal context when its interval lies on the predicted side of zero.
- Tables 1-S5.1, 1-S5.2, 1-S5.7, 1-S5.8 and 1-S5.11: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information.
- Tables 1-S5.1 to 1-S5.8 and 1-S5.11: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).
- Tables 1-S5.3 and 1-S5.5: Differences of adjusted condition means with their standard errors, Student t tests and two-sided 95% Student t intervals on the residual degrees of freedom of each model; no adjustment for multiple comparisons.
- Tables 1-S5.3 to 1-S5.5: Likelihood ratings are in points on the 0–100 scale; foreseeability is in points on the 1–5 scale.
- Tables 1-S5.3 to 1-S5.6: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.
- Tables 1-S5.5 and 1-S5.6: The decision is read from the model with attitudes.

Table 1-S5.1

Indirect effects of outcome information on pregnancy-evidence likelihood and foreseeability, by legal context

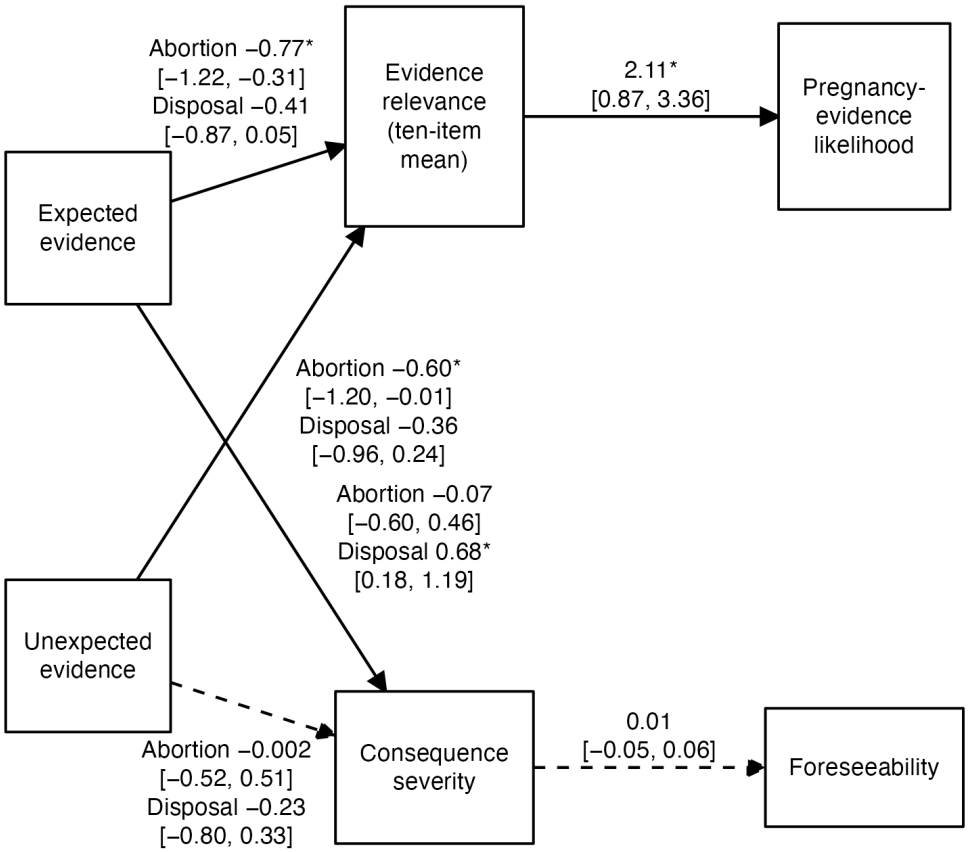

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → evidence relevance → pregnancy-evidence likelihood	H1a	−1.618	[−3.362, −0.397]	Positive	not supported
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	H1b	−1.275	[−3.049, −0.028]	Negative	supported

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Expected evidence → consequence severity → foreseeability	H1c	−0.001	[−0.020, 0.017]	Positive	not supported
Unexpected evidence → consequence severity → foreseeability	H1d	0.0000	[−0.016, 0.017]	Positive	not supported
Improper disposal					
Expected evidence → evidence relevance → pregnancy-evidence likelihood	H1a	−0.867	[−2.134, 0.097]	Positive	not supported
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	H1b	−0.758	[−2.360, 0.526]	Negative	not supported
Expected evidence → consequence severity → foreseeability	H1c	0.006	[−0.040, 0.047]	Positive	not supported
Unexpected evidence → consequence severity → foreseeability	H1d	−0.002	[−0.029, 0.019]	Positive	not supported

Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-outcome paths, in pregnancy-evidence likelihood points or foreseeability scale points per outcome contrast. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Global fit: Table 1-S4.1 (registered model).

Figure 1-S5.1

Fitted hindsight-pathway chains

Note. Registered H1 model in the primary sample. Ten-item mean relevance mediates the likelihood route (H1a–H1b), and consequence severity mediates the foreseeability route (H1c–H1d). Path labels give unstandardized estimates in the original units, with robust (Huber–White) Wald 95% intervals. Outcome-to-mediator paths have separate Abortion (illegal abortion) and Disposal (improper disposal) estimates; relevance-to-likelihood and severity-to-foreseeability paths share estimates across contexts. Dashed paths have intervals containing zero for the shared estimate or for both context estimates. The tables report the indirect effects and omitted direct outcome paths, attitude slopes, and disturbance covariances. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S5.2

Legal-context comparisons of the hindsight pathways in the registered H1 model

Quantity	Letter	Estimate	95% CI	Test	p
Outcome-to-mediator coefficients, abortion minus disposal (robust Wald)					
Expected evidence → evidence relevance	E1a	−0.355 (0.332)	[−1.005, 0.295]	$\chi^2(1) = 1.14$	.285
Unexpected evidence → evidence relevance	E1a	−0.245 (0.427)	[−1.081, 0.592]	$\chi^2(1) = 0.33$	.568
Expected evidence → consequence severity	E1b	−0.749 (0.375)	[−1.484, −0.014]	$\chi^2(1) = 4.17$	.041
Unexpected evidence → consequence severity	E1b	0.232 (0.388)	[−0.529, 0.992]	$\chi^2(1) = 0.35$	.552
Indirect effects, abortion minus disposal (percentile bootstrap)					
Expected evidence → evidence relevance → pregnancy-evidence likelihood	E1a	−0.750	[−2.634, 0.568]	—	—
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	E1a	−0.517	[−2.640, 1.327]	—	—
Expected evidence → consequence severity → foreseeability	E1b	−0.006	[−0.056, 0.046]	—	—
Unexpected evidence → consequence severity → foreseeability	E1b	0.002	[−0.022, 0.035]	—	—
Joint equality tests (scaled chi-square difference)					
Relevance paths jointly	E1a	—	—	$\chi^2(2) = 0.82$	.664
Severity paths jointly	E1b	—	—	$\chi^2(2) = 7.25$	.027

Quantity	Letter	Estimate	95% CI	Test	p
Both sets of outcome-to-mediator paths	E1b	—	—	$\chi^2(4) = 7.93$	.094

Note. Differences are abortion minus disposal. Coefficient differences: unstandardized, with robust (Huber–White) SE and normal Wald 95% intervals, and the one-df scaled chi-square difference test of their equality. Indirect-effect differences: two-sided 95% percentile bootstrap intervals (type 6) from 10,000 participant resamples stratified within the six conditions, 10,000 usable. Joint tests: Satorra–Bentler (2010) scaled chi-square differences of the models with the named paths equal across contexts. Reported without a verdict (no registered decision rule).

Table 1-S5.3

Adjusted-mean differences in abortion-evidence likelihood, disposal-evidence likelihood and foreseeability, by legal context

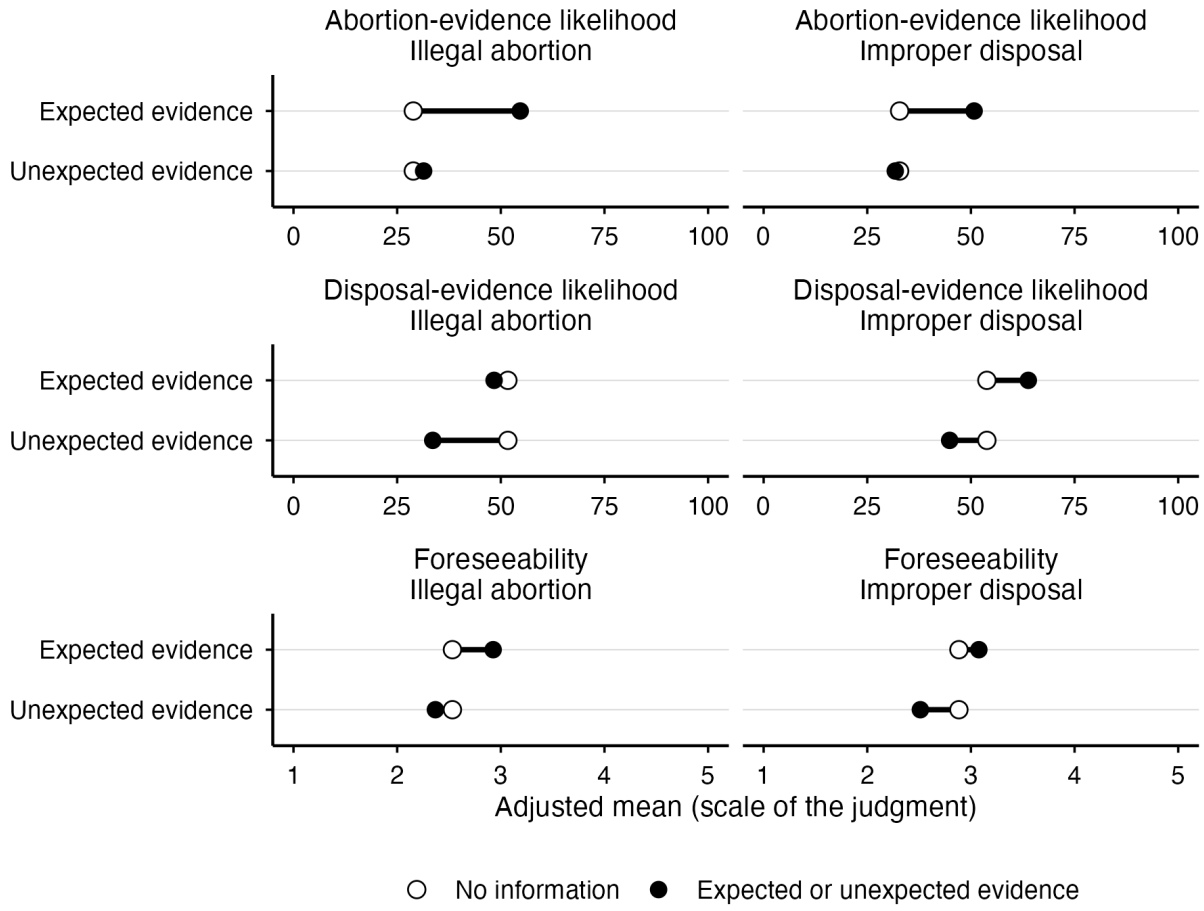

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI	Decision
Illegal abortion									
Abortion-evidence likelihood: expected evidence – no information	E2a	Positive	25.79	4.72	5.46	388	< .001	[16.50, 35.08]	supported
Abortion-evidence likelihood: unexpected evidence – no information	E2b	Negative	2.49	4.72	0.53	388	.598	[−6.80, 11.77]	not supported
Disposal-evidence likelihood: expected evidence – no information	E2c	Positive	−3.32	5.22	−0.64	388	.525	[−13.59, 6.95]	not supported
Disposal-evidence likelihood: unexpected evidence – no information	E2d	Negative	−18.12	5.22	−3.47	388	< .001	[−28.38, −7.85]	supported
Foreseeability: unexpected evidence – no information	E2e	Negative	−0.164	0.159	−1.03	388	.303	[−0.478, 0.149]	not supported
Foreseeability: unexpected evidence – expected evidence	E2f	Negative	−0.557	0.163	−3.42	388	< .001	[−0.877, −0.237]	supported
Improper disposal									
Abortion-evidence likelihood: expected evidence – no information	E2a	Positive	17.97	4.67	3.85	388	< .001	[8.79, 27.15]	supported

Comparison	Letter	Predicted	Difference	SE	t	df	p	95% CI	Decision
Abortion-evidence likelihood: unexpected evidence – no information	E2b	Negative	−1.05	4.61	−0.23	388	.820	[−10.11, 8.01]	not supported
Disposal-evidence likelihood: expected evidence – no information	E2c	Positive	9.99	5.16	1.94	388	.054	[−0.16, 20.14]	not supported
Disposal-evidence likelihood: unexpected evidence – no information	E2d	Negative	−8.97	5.09	−1.76	388	.079	[−18.98, 1.04]	not supported
Foreseeability: unexpected evidence – no information	E2e	Negative	−0.372	0.155	−2.39	388	.017	[−0.678, −0.066]	supported
Foreseeability: unexpected evidence – expected evidence	E2f	Negative	−0.565	0.159	−3.54	388	< .001	[−0.878, −0.251]	supported

Note. Each model holds the four attitudes at their means. Predicted = the registered sign of the difference.

Figure 1-S5.2

Adjusted mean abortion-evidence likelihood, disposal-evidence likelihood and foreseeability: no information against expected and unexpected evidence, by legal context

Note. Adjusted means of likelihood (0–100) and foreseeability (1–5), with the four attitudes at their primary-sample means. Each line connects the no-information mean to the expected- or unexpected-evidence mean, using a separate scale for each panel. I plotted the means without intervals; Student *t* intervals for their comparisons appear in the table. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S5.4

Equivalence tests of the expected-evidence difference in foreseeability and financial-crime evidence likelihood, by legal context

Bounds	Difference	SE	df	90% CI	p, lower bound	p, upper bound	Reading	Decision
Foreseeability (E2g), illegal abortion								
±0.20 (registered)	0.393	0.159	388	[0.130, 0.656]	< .001	.887	Difference	not supported
±0.10 (sensitivity)	0.393	0.159	388	[0.130, 0.656]	.001	.967	Difference	—
±0.30 (sensitivity)	0.393	0.159	388	[0.130, 0.656]	< .001	.720	Difference	—
Foreseeability (E2g), improper disposal								
±0.20 (registered)	0.192	0.158	388	[−0.067, 0.452]	.007	.481	Inconclusive	not supported
±0.10 (sensitivity)	0.192	0.158	388	[−0.067, 0.452]	.032	.721	Inconclusive	—
±0.30 (sensitivity)	0.192	0.158	388	[−0.067, 0.452]	< .001	.248	Inconclusive	—
Financial-crime evidence likelihood (E2h), illegal abortion								
±5 (registered)	−1.95	4.89	388	[−10.02, 6.12]	.267	.078	Inconclusive	not supported
±3 (sensitivity)	−1.95	4.89	388	[−10.02, 6.12]	.415	.156	Inconclusive	—
±8 (sensitivity)	−1.95	4.89	388	[−10.02, 6.12]	.109	.021	Inconclusive	—
Financial-crime evidence likelihood (E2h), improper disposal								
±5 (registered)	−1.32	4.84	388	[−9.30, 6.66]	.224	.096	Inconclusive	not supported
±3 (sensitivity)	−1.32	4.84	388	[−9.30, 6.66]	.364	.186	Inconclusive	—

Bounds	Difference	SE	df	90% CI	p, lower bound	p, upper bound	Reading	Decision
±8 (sensitivity)	−1.32	4.84	388	[−9.30, 6.66]	.084	.027	Inconclusive	—

Note. Difference = adjusted mean after expected evidence minus adjusted mean after no information, from the model with the four attitudes. Interval: Student t, 90%, on the residual degrees of freedom. The two p values are the one-sided Student t tests against the lower and the upper bound. Reading = equivalent when the 90% confidence interval lies entirely within the row's bounds; otherwise, difference when the interval excludes zero, or inconclusive when it includes zero. Only the registered bounds determined support. Sensitivity bounds illustrated dependence on the choice of bounds.

Table 1-S5.5

Difference between the legal contexts in the expected-evidence comparison of abortion-evidence likelihood

Model	Letter	Predicted	Difference	SE	t	df	p	95% CI	Decision
With the four attitudes (registered)	E3a	Positive	7.82	6.62	1.18	388	.238	[−5.19, 20.83]	not supported
Without attitudes	E3a	Positive	7.11	6.84	1.04	392	.299	[−6.34, 20.56]	—

Note. Difference = the expected-evidence minus no-information difference in the illegal-abortion context minus the same difference in the improper-disposal context, from the saved abortion-evidence models.

Table 1-S5.6

Comparisons of the specific-minus-general foreseeability difference, with and without the attitudes

Comparison	Letter	Predicted	Difference	SE	z	p	95% CI	Decision
With the four attitudes (registered)								
Unexpected evidence – no information, illegal abortion	E5a	Negative	−0.233	0.179	−1.30	.194	[−0.585, 0.118]	not supported
Expected evidence – no information, illegal abortion	—	None	0.114	0.147	0.77	.440	[−0.175, 0.403]	—
Unexpected evidence – no information, improper disposal	E5a	Negative	−0.091	0.156	−0.58	.562	[−0.397, 0.216]	not supported
Expected evidence – no information, improper disposal	—	None	0.113	0.156	0.72	.470	[−0.193, 0.419]	—
Without attitudes								
Unexpected evidence – no information, illegal abortion	E5a	Negative	−0.238	0.181	−1.31	.189	[−0.592, 0.117]	—
Expected evidence – no information, illegal abortion	—	None	0.120	0.148	0.81	.420	[−0.171, 0.410]	—

Comparison	Letter	Predicted	Difference	SE	z	p	95% CI	Decision
Unexpected evidence – no information, improper disposal	E5a	Negative	−0.096	0.156	−0.62	.538	[−0.401, 0.209]	—
Expected evidence – no information, improper disposal	—	None	0.124	0.154	0.80	.421	[−0.178, 0.425]	—

Note. Difference = specific-minus-general foreseeability after outcome information minus the same difference after no information, within legal context. Specific foreseeability is the four-item composite; both measures use the 1–5 scale. Each joint normal maximum-likelihood model included 398 participants. SE = standard error; 95% CI = normal Wald confidence interval. CIs, z tests, and p values use the same model-based SE. Only the unexpected-evidence comparison had an E5a directional prediction.

Table 1-S5.7

Expected-Evidence × Item-Consistency Interaction in the Registered Ten-Item and Eight-Item Sensitivity Analyses

Analysis	Estimate	SE	df	95% CI	Predicted	Random structure	Ratings	Participants	Decision
Registered analysis (ten items)	1.258	0.264	395.0	[0.738, 1.777]	Positive	Correlated slope	3,980	398	supported
Sensitivity analysis (eight items; added analysis, not registered)	1.459	—	—	[0.899, 2.020]	Positive	Correlated slope	3,184	398	not a support criterion

Note. Positive estimates indicate larger expected-evidence versus no-information differences for consistent than inconsistent items (1–9 scale). E4a support required the ten-item 95% CI entirely above zero. Sensitivity exclusions: items 3 and 10. Shared model and interval method: Table 1-S5.8; fallback: Table 1-S5.10. SE and df are reported only for the ten-item analysis. SE = standard error; df = degrees of freedom; CI = confidence interval.

Table 1-S5.8

Mixed-Effects Model of Evidence Relevance

Term	Estimate	SE	df	t	p	95% CI
Fixed effects						
Intercept	6.031	0.570	9.7	10.58	< .001	[4.756, 7.306]
Expected evidence	−0.958	0.228	386.5	−4.19	< .001	[−1.407, −0.509]
Unexpected evidence	−0.552	0.226	384.2	−2.44	.015	[−0.997, −0.107]
Item consistency (consistent = 1)	0.089	1.006	8.5	0.09	.931	[−2.207, 2.386]
Legal context (improper disposal = 1)	0.011	0.165	390.0	0.07	.946	[−0.313, 0.335]
Abortion attitudes	−0.003	0.004	390.0	−0.65	.516	[−0.011, 0.006]
Support for punishment	0.174	0.068	390.0	2.56	.011	[0.040, 0.308]
Hostile sexism	−0.040	0.080	390.0	−0.49	.622	[−0.198, 0.118]

Expected evidence × item consistency	1.258	0.264	395.0	4.76	< .001	[0.738, 1.777]
Unexpected evidence × item consistency	0.252	0.264	395.0	0.95	.340	[−0.267, 0.770]
Variance components						
Participant intercept variance	2.846					
Participant consistency slope variance	2.711					
Participant intercept–consistency slope covariance	−1.290 (r = −.465)					
Item intercept variance	2.053					

Term	Estimate	SE	df	t	p	95% CI
Residual variance	4.111					

Note. N = 398 participants (3,980 ratings; 1–9 scale). Unstandardized coefficients from a model with crossed participant and item intercepts and a participant consistency slope correlated with its intercept. Reference categories: no information and illegal abortion. Attitudes were grand-mean centered. Tests and two-sided 95% t CIs used REML covariance and Satterthwaite df. Parentheses give the intercept–slope correlation. REML = restricted maximum likelihood; SE = standard error; df = degrees of freedom; CI = confidence interval.

Table 1-S5.9

Variance Components and Intraclass Correlations for Relevance Ratings

Level	Variance	ICC
Participants	2.335	.258
Items	1.900	.210
Residual	4.806	—

Note. ICC = intraclass correlation coefficient: participant or item variance divided by total variance, including residual variance. No-predictor model with crossed random intercepts, estimated by restricted maximum likelihood.

Table 1-S5.10

Test of the Participant Consistency Slope

Quantity	Value
REML likelihood-ratio statistic, random slope against fixed slope	172.35
Reference distribution	Equal mixture of chi-square distributions with 1 and 2 degrees of freedom
p	< .001
Random structure used	participant random intercept and consistency slope, correlated (the registered structure)
Steps of the registered fallback ladder	None: the registered structure converged and was not singular

Note. REML = restricted maximum likelihood. Two added parameters: participant slope variance and intercept–slope covariance. Reference distribution: equal mixture of $\chi^2(1)$ and $\chi^2(2)$. Significance did not determine slope retention. Simplification required nonconvergence or singularity, removing covariance before slope.

Table 1-S5.11

Descriptive Differences in Item Relevance by Outcome Information

	Expected evidence – no information		Unexpected evidence – no information	
Item	**Difference**	**95% CI**	**Difference**	**95% CI**
Consistent with expected evidence				
Item 1	1.240	[0.632, 1.847]	−0.042	[−0.705, 0.621]
Item 6	−0.103	[−0.746, 0.540]	−0.175	[−0.863, 0.514]
Item 7	−0.263	[−0.846, 0.321]	−0.634	[−1.279, 0.011]
Inconsistent with expected evidence				
Item 2	−1.536	[−2.158, −0.914]	−0.741	[−1.407, −0.076]
Item 3	−0.395	[−0.981, 0.191]	−0.057	[−0.667, 0.553]
Item 4	−0.918	[−1.569, −0.266]	−0.186	[−0.867, 0.494]
Item 5	−1.545	[−2.152, −0.938]	−0.942	[−1.590, −0.295]
Item 8	−1.259	[−1.838, −0.680]	−0.986	[−1.598, −0.374]
Item 9	−0.563	[−1.134, 0.007]	−0.608	[−1.233, 0.016]

	Expected evidence – no information		Unexpected evidence – no information	
Item	**Difference**	**95% CI**	**Difference**	**95% CI**
Item 10	−0.515	[−1.139, 0.109]	−0.234	[−0.858, 0.389]

Note. Difference = observed outcome-information mean – no-information mean (1–9 scale), equally weighted across legal contexts. CIs are two-sided 95% Welch confidence intervals; no covariates or adjustment for multiple comparisons. All items were inconsistent with unexpected evidence.

Figure 1-S5.3

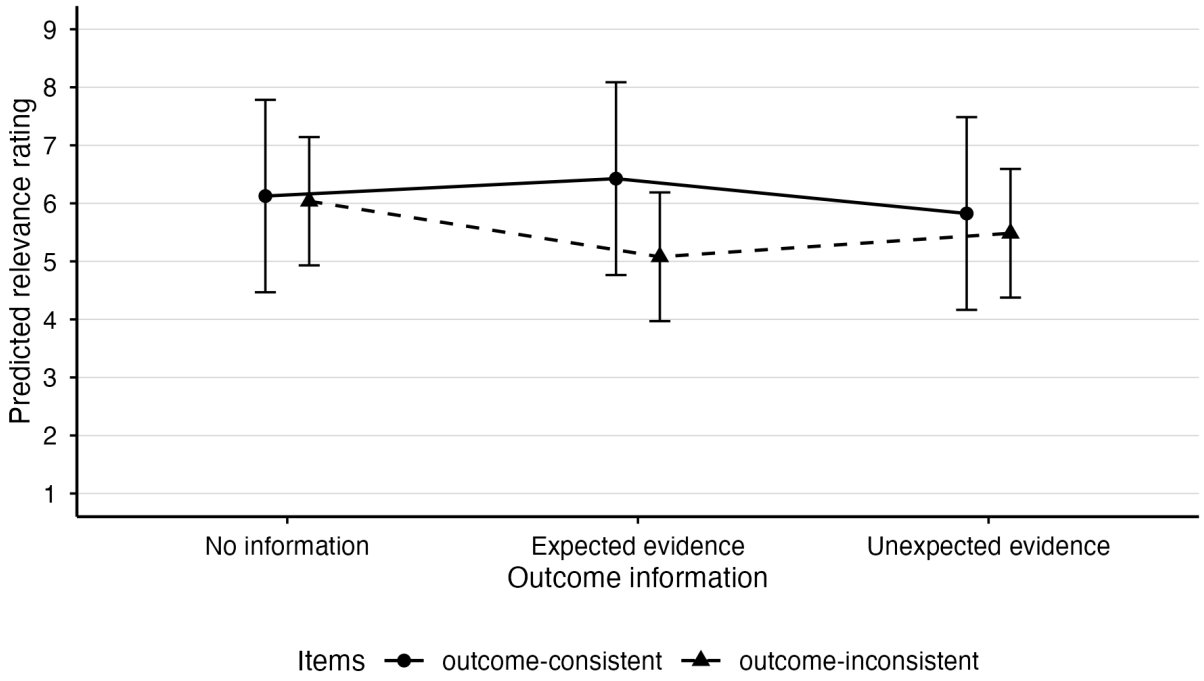

Mean rated relevance of each evidence item after no information and after outcome information

Note. Points are the mean observed relevance ratings (1 to 9) of each item, with the two legal contexts weighted equally. Each line runs from the mean after no information to the mean after the outcome information in that panel. I show the means without intervals here. The item-difference table gives the differences and their unadjusted Welch 95% intervals. Table 1-S5.7 gives the registered coefficient. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Figure 1-S5.4

Model-predicted relevance of the outcome-consistent and outcome-inconsistent items after each kind of outcome information

Note. I used the mixed model to predict relevance ratings on the 1 to 9 scale. The points compare items consistent with expected evidence (i.e., 1, 6, and 7) with inconsistent items (i.e., 2, 3, 4, 5, 8, 9, and 10) under each outcome-information condition. I set the random effects to zero to obtain population means, holding attitudes at their participant means and weighting the legal contexts equally. The bars describe uncertainty in each mean: normal-based 95% intervals calculated by the delta method from the REML fixed-effect covariance. Their overlap does not test E4a. The registered comparison is the change in the difference between item sets from no information to expected evidence, reported in Table 1-S5.7. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Foreseeability: unexpected evidence – no information	E2e	−0.164	[−0.478, 0.149]	−0.161	[−0.480, 0.157]
Foreseeability: unexpected evidence – expected evidence	E2f	−0.557	[−0.877, −0.237]	−0.563	[−0.888, −0.239]
Table 1-S5.3, improper disposal					
Abortion-evidence likelihood: expected evidence – no information	E2a	17.97	[8.79, 27.15]	19.12	[9.72, 28.52]
Abortion-evidence likelihood: unexpected evidence – no information	E2b	−1.05	[−10.11, 8.01]	−1.42	[−10.79, 7.94]

		With the four attitudes (registered)		Without the attitudes	
Quantity	**Letter**	**Estimate**	**Interval**	**Estimate**	**Interval**
Disposal-evidence likelihood: expected evidence – no information	E2c	9.99	[−0.16, 20.14]	10.89	[0.68, 21.11]
Disposal-evidence likelihood: unexpected evidence – no information	E2d	−8.97	[−18.98, 1.04]	−8.37	[−18.54, 1.81]
Foreseeability: unexpected evidence – no information	E2e	−0.372	[−0.678, −0.066]	−0.362	[−0.672, −0.051]
Foreseeability: unexpected evidence – expected evidence	E2f	−0.565	[−0.878, −0.251]	−0.587	[−0.903, −0.271]

Note. Paired estimates with and without the four attitude covariates. Group labels identify source tables for model and interval specifications. For the scaled chi-square joint equality tests of the relevance paths (E1a), severity paths (E1b), and both sets of outcome-to-mediator paths (E1b) in the model with the four attitude covariates, see Table 1-S5.2 and its Note.

S6. RQ2: exploratory analyses

Notes shared by tables of this section.

- Tables 1-S6.1 to 1-S6.3: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.
- Tables 1-S6.1 to 1-S6.3: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

E6a–E6b tested direct outcome coefficients; E6c–E6f tested full pathways within each legal context (Tables 1-S6.2 and 1-S6.3). Support required a 95% confidence interval excluding zero in the predicted direction. Other rows, including differences between legal contexts, had no registered decision rule.

Table 1-S6.1

Differences between the legal contexts in the outcome comparisons of decision quality and the evaluations of the detective

Comparison	Difference	SE	t	df	p	95% CI
Decision quality						
Expected evidence – no information, abortion minus disposal	−0.53	0.40	−1.32	388	.186	[−1.32, 0.26]
Unexpected evidence – no information, abortion minus disposal	0.38	0.40	0.94	388	.346	[−0.41, 1.16]
Expected evidence – unexpected evidence, abortion minus disposal	−0.91	0.41	−2.23	388	.026	[−1.70, −0.11]
Detective blame						
Expected evidence – no information, abortion minus disposal	0.81	0.88	0.92	388	.359	[−0.93, 2.55]
Unexpected evidence – no information, abortion minus disposal	−0.54	0.88	−0.62	388	.539	[−2.27, 1.19]

Comparison	Difference	SE	t	df	p	95% CI
Expected evidence – unexpected evidence, abortion minus disposal	1.35	0.90	1.51	388	.132	[−0.41, 3.11]
Consequences for the detective						
Expected evidence – no information, abortion minus disposal	1.27	0.76	1.66	388	.098	[−0.24, 2.77]
Unexpected evidence – no information, abortion minus disposal	−0.17	0.76	−0.22	388	.826	[−1.66, 1.33]
Expected evidence – unexpected evidence, abortion minus disposal	1.43	0.78	1.85	388	.065	[−0.09, 2.96]
Wrongness of the detective's decision						
Expected evidence – no information, abortion minus disposal	0.97	0.82	1.18	388	.240	[−0.65, 2.59]
Unexpected evidence – no information, abortion minus disposal	0.21	0.82	0.26	388	.797	[−1.40, 1.83]
Expected evidence – unexpected evidence, abortion minus disposal	0.76	0.84	0.91	388	.365	[−0.89, 2.40]

Note. Each row is an outcome comparison in the illegal-abortion context minus the same comparison in the improper-disposal context, from the saved model with the four attitudes, with its Student t test and two-sided 95% Student t interval on the residual degrees of freedom; no adjustment for multiple comparisons. Reported without a verdict (no registered direction or decision rule). The rows without attitudes are in the companion table. Decision quality is in points on the 1–7 scale; detective blame, deserved consequences and wrongness are in points on their 0–10 scales.

Table 1-S6.2

Direct outcome coefficients and judgment slopes of the decision-quality equation, by legal context, with their legal-context comparisons

Quantity	Letter	Estimate	95% CI	Test	p	Decision
Illegal abortion: coefficients (robust Wald)						
Expected evidence → decision quality (direct)	E6a	−0.031 (0.229)	[−0.480, 0.418]	—	—	not supported
Unexpected evidence → decision quality (direct)	E6b	0.465 (0.232)	[0.010, 0.919]	—	—	supported
Improper disposal: coefficients (robust Wald)						
Expected evidence → decision quality (direct)	E6a	0.414 (0.216)	[−0.010, 0.839]	—	—	not supported
Unexpected evidence → decision quality (direct)	E6b	0.237 (0.224)	[−0.202, 0.677]	—	—	not supported
Abortion minus disposal (robust Wald difference; scaled chi-square difference test)						
Expected evidence → decision quality (direct)	—	−0.445 (0.315)	[−1.063, 0.173]	$\chi^2(1) = 1.97$	.161	—
Unexpected evidence → decision quality (direct)	—	0.227 (0.322)	[−0.405, 0.859]	$\chi^2(1) = 0.49$	.482	—
Consequence severity → decision quality	—	−0.003 (0.093)	[−0.185, 0.179]	$\chi^2(1) = 0.00$	.974	—
Pregnancy-evidence likelihood → decision quality	—	−0.003 (0.007)	[−0.016, 0.010]	$\chi^2(1) = 0.24$	.628	—

Quantity	Letter	Estimate	95% CI	Test	p	Decision
Foreseeability → decision quality	—	0.108 (0.171)	[−0.227, 0.442]	$\chi^2(1)$ = 0.40	.527	—
Joint equality test (scaled chi-square difference)						
The five coefficients jointly equal across contexts	—	—	—	$\chi^2(5)$ = 4.36	.499	—

Note. Unstandardized coefficients of the decision-quality equation in the original units (decision-quality points per point of the predictor; the outcome coefficients against no information), with robust (Huber–White) standard errors in parentheses and normal Wald 95% intervals. Differences are abortion minus disposal, each with the one-degree-of-freedom Satorra–Bentler (2010) scaled chi-square difference test of its equality; the joint test constrains the five coefficients together. The preference and attitude slopes stay free across contexts, as registered. The other slopes of the decision-quality equation in each legal context are in Table 1-S4.12. Global fit: Table 1-S4.11 (registered model).

Table 1-S6.3

Pathways from outcome information to decision quality, by legal context, with their legal-context differences

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → relevance → likelihood → decision quality	E6c	−0.0360	[−0.0841, −0.0081]	Positive	not supported

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → severity → foreseeability → decision quality	—	0.0008	[−0.0114, 0.0178]	None	—
Unexpected evidence → foreseeability → decision quality	—	−0.0298	[−0.1528, 0.0649]	None	—
Unexpected evidence → foreseeability pathways summed	—	−0.0290	[−0.1527, 0.0691]	None	—
Unexpected evidence → severity → decision quality	—	0.0140	[−0.0610, 0.0948]	None	—

Note. I calculated each pathway as the product of its unstandardized paths from the outcome contrast to decision quality. The estimates are in decision-quality points. Summed rows add the full pathway and the shorter pathway through the same judgment. For the two-sided 95% percentile bootstrap intervals, I used type 6 quantiles from 10,000 participant resamples within the six conditions; all 10,000 were usable. The abortion-minus-disposal differences use those same resamples. Predicted identifies the registered sign; None identifies a pathway or difference with no registered direction.

Figure 1-S6.1

Fitted decision-quality chains (E6a–E6f)

Note. E6a–E6b are the direct paths to decision quality, E6c–E6d run through relevance and likelihood, and E6e–E6f run through severity and foreseeability. I fitted the registered H2a–H2b and E6 model in the primary sample with ten-item relevance means. Abortion and Dis-

posal denote illegal abortion and improper disposal. Path labels give unstandardized estimates in the original units and robust (Huber–White) Wald 95% intervals. I estimated outcome-to-mediator and decision-quality paths separately by legal context, with common relevance-to-likelihood and severity-to-foreseeability paths. Dashed paths have a shared interval containing zero or both context intervals containing zero. The tables report indirect effects and the omitted search-error-preference path, direct outcome paths to likelihood and foreseeability, attitude slopes, and disturbance covariances. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Note. For each quantity, the table presents the saved estimate and interval from the model with four attitude covariates alongside the saved estimate and interval from its no-attitudes companion. The band identifies the source table, where the Note specifies the units, interval procedure, model, sample, and fit. — identifies a quantity without a registered letter. Table 1-S4.12′s decision-quality equation reports the registered coefficients for the unlettered rows of the Table 1-S6.2 bands.

S7. RQ3: Exploratory Suspect Judgments

Notes shared by tables of this section.

- Tables 1-S7.1 to 1-S7.3: The judgments tested here are rated on the 1–7 scale; differences and means are in scale points.
- Tables 1-S7.1 to 1-S7.17: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.
- Tables 1-S7.1 to 1-S7.3 and 1-S7.5 to 1-S7.18: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).
- Tables 1-S7.2 and 1-S7.4: n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis).
- Tables 1-S7.4 and 1-S7.7 to 1-S7.14: Blame, punishment, the four mental states, responsibility and wrongness are rated on the 1–7 scale; differences are in scale points.
- Tables 1-S7.5, 1-S7.7, 1-S7.8, 1-S7.14 and 1-S7.15: Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable.
- Tables 1-S7.5 and 1-S7.15: The model is just-identified, so it has no global fit.
- Tables 1-S7.5, 1-S7.7, 1-S7.14 and 1-S7.15: A letter is supported when its interval lies on the predicted side of zero.
- Tables 1-S7.5 and 1-S7.6: Every row of this analysis uses pregnancy-evidence likelihood as the substitute mediator (deviation 2 in S1).
- Tables 1-S7.6 and 1-S7.17: Unstandardized estimates in the original units with robust (Huber–White) standard errors, normal Wald 95% intervals and two-sided p.
- Tables 1-S7.6 and 1-S7.17: β = the standardized estimate (std.all) of the same path; inference and decisions use the unstandardized estimates.
- Tables 1-S7.7 and 1-S7.8: Differences of adjusted outcome-condition means, each the equal-weight average of the two within-context differences, from analyses of covariance with the four attitudes as covariates.
- Tables 1-S7.7, 1-S7.8 and 1-S7.14: No item was missing, so no values were imputed.
- Tables 1-S7.9, 1-S7.11 and 1-S7.12: Interval: Normal Wald, two-sided 95%; the test statistic and p from the same standard error. n = 398.
- Tables 1-S7.9, 1-S7.11 and 1-S7.12: I calculated the comparisons jointly from the model of all four ratings.

- Tables 1-S7.9, 1-S7.11 and 1-S7.12: The model has an outcome-condition intercept in each legal context and unrestricted residual covariances.
- Tables 1-S7.9, 1-S7.11 and 1-S7.12: The comparisons hold attitudes at their means and include variation in that attitude reference in their standard errors.

Table 1-S7.1

Expected evidence – unexpected evidence	1.72	0.24	7.04	< .001	[1.24, 2.19]

Note. Differences of adjusted outcome-condition means, each the equal-weight average of the two within-context differences, from a separate analysis of covariance of each judgment with the four attitudes as covariates: the registered H3a–H3b blame model with only the response changed. The two-sided p values and Student t 95% intervals use the conventional OLS covariance and residual df. I added these exploratory comparisons after seeing the registered results; they have no letter, support decision, or multiplicity correction. Higher scores indicate a more favorable impression and more justified reasons. Each analysis uses complete cases for its judgment and the attitudes: n = 398 in the adjusted primary sample.

Note. The comparisons of the table above from the same model without the attitudes, and in the registered sensitivity sample with and without them; Student t 95% intervals. Exploratory. n: primary without attitudes 398; sensitivity with attitudes 341, without 341.

Table 1-S7.3

Exploratory (no registered letter; added analysis, not registered): adjusted means of the judgments tested here, by condition (primary sample, with the attitudes)

	Illegal abortion			Improper disposal		
Judgment	**No information**	**Expected evidence**	**Unexpected evidence**	**No information**	**Expected evidence**	**Unexpected evidence**
Causality	2.69 [2.28, 3.09]	5.66 [5.24, 6.09]	2.65 [2.23, 3.08]	2.49 [2.09, 2.89]	6.01 [5.59, 6.42]	2.61 [2.21, 3.02]

Judgment	Illegal abortion			Improper disposal		
	No information	**Expected evidence**	**Unexpected evidence**	**No information**	**Expected evidence**	**Unexpected evidence**
Preventability	2.76 [2.36, 3.16]	5.45 [5.04, 5.87]	3.11 [2.69, 3.52]	2.58 [2.19, 2.97]	5.72 [5.31, 6.12]	2.54 [2.14, 2.94]
Favorable impression (higher = more favorable)	4.19 [3.83, 4.54]	3.34 [2.97, 3.70]	3.58 [3.21, 3.94]	4.55 [4.20, 4.89]	2.87 [2.51, 3.23]	3.40 [3.05, 3.76]
Justified reasons (higher = more justified)	4.04 [3.60, 4.49]	3.87 [3.41, 4.34]	3.94 [3.47, 4.40]	4.56 [4.12, 5.00]	3.60 [3.14, 4.06]	4.01 [3.56, 4.46]
Wrongness apart from the law	3.67 [3.24, 4.10]	4.18 [3.73, 4.63]	4.31 [3.87, 4.76]	3.39 [2.96, 3.81]	4.77 [4.33, 5.21]	4.29 [3.86, 4.72]
Wrongness given the charge	3.62 [3.18, 4.05]	3.99 [3.54, 4.44]	3.80 [3.35, 4.26]	3.13 [2.70, 3.56]	4.77 [4.33, 5.22]	4.18 [3.74, 4.61]
Counterfactual availability	4.03 [3.59, 4.46]	5.39 [4.94, 5.84]	5.02 [4.57, 5.47]	4.14 [3.71, 4.56]	4.98 [4.53, 5.42]	4.83 [4.39, 5.26]
Suspect wrongness	2.97 [2.52, 3.42]	4.03 [3.56, 4.50]	3.88 [3.41, 4.35]	2.78 [2.33, 3.22]	4.73 [4.27, 5.19]	3.80 [3.34, 4.25]
Responsibility	3.16 [2.70, 3.62]	5.56 [5.08, 6.04]	3.46 [2.98, 3.94]	3.41 [2.95, 3.86]	5.62 [5.15, 6.10]	4.29 [3.83, 4.76]

Note. Each entry is the model-implied mean rating with its Student t 95% interval, from each judgment's analysis of covariance above, at the attitude means of the participants in the model. Exploratory.

Table 1-S7.4

Exploratory addition: E7a–E7g and E8c in the sensitivity sample (registered models with the attitudes; the sensitivity-sample rows carry no decision)

		Sensitivity sample	
Comparison	**Letter**	**Difference**	**95% CI**
Punishment			
Expected evidence – no information	E7a	1.10	[0.70, 1.51]
Unexpected evidence – no information	E7b	0.34	[−0.09, 0.77]
Expected evidence – unexpected evidence	E7c	0.76	[0.35, 1.18]
Recklessness			
Expected evidence – no information	E7d	2.77	[2.38, 3.15]
Unexpected evidence – no information	—	−0.25	[−0.67, 0.18]
Expected evidence – unexpected evidence	E7e	3.01	[2.61, 3.43]
Negligence			
Expected evidence – no information	E7f	2.54	[2.14, 2.91]
Unexpected evidence – no information	—	−0.36	[−0.78, 0.06]
Expected evidence – unexpected evidence	E7g	2.90	[2.50, 3.28]
Negligence minus purpose			
Expected evidence – no information	—	−0.90	[−1.24, −0.58]
Unexpected evidence – no information	—	−0.43	[−0.79, −0.07]
Expected evidence – unexpected evidence	E8c	−0.47	[−0.80, −0.15]

Note. Each comparison averages the two legal-context differences equally, using adjusted outcome means from the registered analyses of covariance and percentile bootstrap 95% intervals. Tables 1-S7.7 and 1-S7.14 report the primary-sample estimates that supply decisions. The sensitivity-sample estimates carry no verdict and used 10000 usable bootstrap draws. The E8a and E8b comparisons in the sensitivity sample, and the condition means of blame, responsibility, punishment and wrongness from E8b's joint model, are saved with the analysis.

Table 1-S7.5

Substitute analysis of H3c–H3e: indirect effects of outcome information on blame through pregnancy-evidence likelihood, by legal context

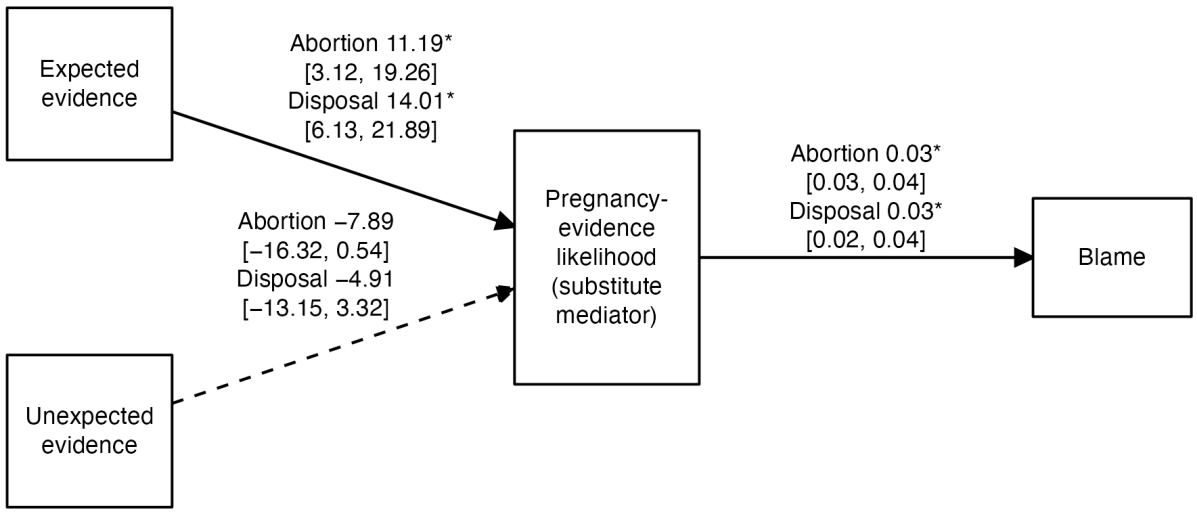

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → pregnancy-evidence likelihood → blame	H3c	0.377	[0.094, 0.698]	Positive	substitute analysis: supported
Unexpected evidence → pregnancy-evidence likelihood → blame	H3d	−0.266	[−0.585, 0.027]	Negative	substitute analysis: not supported
Expected minus unexpected evidence, through pregnancy-evidence likelihood	H3e	0.643	[0.301, 1.044]	Positive	substitute analysis: supported
Improper disposal					
Expected evidence → pregnancy-evidence likelihood → blame	H3c	0.432	[0.161, 0.754]	Positive	substitute analysis: supported
Unexpected evidence → pregnancy-evidence likelihood → blame	H3d	−0.151	[−0.411, 0.103]	Negative	substitute analysis: not supported
Expected minus unexpected evidence, through pregnancy-evidence likelihood	H3e	0.583	[0.295, 0.919]	Positive	substitute analysis: supported
Illegal abortion minus improper disposal					
Expected evidence → pregnancy-evidence likelihood → blame	—	−0.055	[−0.482, 0.359]	None	reported without a verdict

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → pregnancy-evidence likelihood → blame	—	−0.114	[−0.520, 0.272]	None	reported without a verdict

Note. The registered mediator was not administered, so I used pregnancy-evidence likelihood in its place (deviation item 2). These decisions apply to the substitute analysis, not the registered test. Each indirect effect multiplies the unstandardized outcome-to-mediator path by the mediator-to-blame path, giving blame points per outcome contrast. The abortion-minus-disposal rows subtract those products across the two legal contexts.

Figure 1-S7.1

Substitute analysis of H3c–H3e: the fitted chain of blame through pregnancy-evidence likelihood

Note. Fitted substitute model of outcome information and suspect blame through pregnancy-evidence likelihood, with the four attitudes in the primary sample (deviation 2 in S1). H3c concerns expected evidence and H3d unexpected evidence; H3e compares their indirect effects. Unstandardized estimates (robust [Huber–White] Wald 95% intervals) appear on each path in the original units. Abortion and Disposal identify the separate illegal-abortion and improper-disposal estimates. I used dashed lines where both context intervals contain zero and solid lines otherwise. The path table reports the direct effects of outcome information on blame, which are omitted here along with the attitude slopes. The indirect-effect table reports the path products. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S7.6

Substitute analysis of H3c–H3e: unstandardized (b) and standardized (β) path estimates, by legal context

	Illegal abortion				Improper disposal			
Predictor	**b (SE)**	**95% CI**	**p**	**β**	**b (SE)**	**95% CI**	**p**	**β**

	Illegal abortion				Improper disposal			
Predictor	**b (SE)**	**95% CI**	**p**	**β**	**b (SE)**	**95% CI**	**p**	**β**
Benevolent sexism	−0.102 (0.106)	[−0.310, 0.106]	.335	−0.060	0.002 (0.109)	[−0.213, 0.216]	.988	0.001

Note. Substitute analysis (deviation item 2). The covariance of the two disturbances is fixed at zero, as registered. R^2 of each endogenous variable from the fitted model, illegal abortion and improper disposal: pregnancy-evidence likelihood .157 and .159; blame .452 and .478.

Table 1-S7.7

Adjusted-mean differences in punishment, recklessness and negligence across the outcome conditions, legal contexts averaged

Comparison	Letter	Predicted	Difference	95% CI	Decision
Punishment					
Expected evidence – no information	E7a	Positive	1.07	[0.69, 1.45]	supported
Unexpected evidence – no information	E7b	Positive	0.37	[−0.04, 0.78]	not supported
Expected evidence – unexpected evidence	E7c	Positive	0.70	[0.30, 1.09]	supported
Recklessness					
Expected evidence – no information	E7d	Positive	2.46	[2.08, 2.83]	supported
Unexpected evidence – no information	—	None	−0.21	[−0.61, 0.19]	reported without a verdict
Expected evidence – unexpected evidence	E7e	Positive	2.67	[2.27, 3.06]	supported
Negligence					
Expected evidence – no information	E7f	Positive	2.38	[2.01, 2.73]	supported
Unexpected evidence – no information	—	None	−0.17	[−0.57, 0.24]	reported without a verdict

Comparison	Letter	Predicted	Difference	95% CI	Decision
Expected evidence – unexpected evidence	E7g	Positive	2.54	[2.15, 2.92]	supported

Note. Common attitude slopes (the registered model). Predicted = the registered sign of the difference; the unexpected-evidence comparisons of recklessness and negligence have no registered direction and are reported without a verdict.

Table 1-S7.8

Comparisons of punishment, recklessness and negligence with the attitude slopes free in each condition (registered sensitivity model)

Comparison	Letter	Predicted	Difference	95% CI
Punishment				
Expected evidence – no information	E7a	Positive	1.04	[0.67, 1.42]
Unexpected evidence – no information	E7b	Positive	0.36	[−0.06, 0.78]
Expected evidence – unexpected evidence	E7c	Positive	0.67	[0.27, 1.08]
Recklessness				
Expected evidence – no information	E7d	Positive	2.47	[2.08, 2.83]
Unexpected evidence – no information	—	None	−0.23	[−0.64, 0.19]
Expected evidence – unexpected evidence	E7e	Positive	2.69	[2.29, 3.08]
Negligence				
Expected evidence – no information	E7f	Positive	2.41	[2.01, 2.76]
Unexpected evidence – no information	—	None	−0.16	[−0.56, 0.26]
Expected evidence – unexpected evidence	E7g	Positive	2.56	[2.13, 2.95]

Note. The attitude slopes are estimated separately in each of the six conditions. Reported to show whether the comparisons depend on common slopes; decisions are read from the registered model only.

Table 1-S7.9

Paired differences between the attributed mental states within each outcome condition, and their legal-context gaps

Contrast	Letter	Estimate	SE	z	p	95% CI
Within each outcome condition, legal contexts averaged equally						
Purpose – knowledge, no information	E8a	−0.07	0.10	−0.65	.513	[−0.26, 0.13]
Purpose – knowledge, expected evidence	E8a	0.26	0.08	3.32	< .001	[0.11, 0.42]
Purpose – knowledge, unexpected evidence	E8a	0.20	0.08	2.58	.010	[0.05, 0.35]
Recklessness – negligence, no information	E8a	−0.26	0.11	−2.30	.021	[−0.48, −0.04]
Recklessness – negligence, expected evidence	E8a	−0.18	0.09	−2.07	.039	[−0.35, −0.01]
Recklessness – negligence, unexpected evidence	E8a	−0.30	0.10	−2.93	.003	[−0.50, −0.10]
Knowledge – recklessness, no information	—	−0.57	0.11	−5.38	< .001	[−0.78, −0.36]
Knowledge – recklessness, expected evidence	—	−0.09	0.11	−0.88	.376	[−0.30, 0.11]
Knowledge – recklessness, unexpected evidence	—	−0.43	0.11	−3.83	< .001	[−0.65, −0.21]
Abortion minus disposal gap of each paired difference						
Purpose – knowledge, no information	E8a	0.25	0.20	1.25	.211	[−0.14, 0.64]
Purpose – knowledge, expected evidence	E8a	0.19	0.16	1.19	.236	[−0.12, 0.50]
Purpose – knowledge, unexpected evidence	E8a	0.03	0.15	0.18	.854	[−0.27, 0.33]
Recklessness – negligence, no information	E8a	−0.17	0.23	−0.74	.462	[−0.61, 0.28]
Recklessness – negligence, expected evidence	E8a	0.09	0.17	0.49	.621	[−0.25, 0.43]

Contrast	Letter	Estimate	SE	z	p	95% CI
Recklessness – negligence, unexpected evidence	E8a	−0.24	0.20	−1.18	.238	[−0.64, 0.16]

Note. Each estimate is a mean within-participant difference between two attributed mental states (purpose minus knowledge, recklessness minus negligence, knowledge minus recklessness) in one outcome condition, with the two legal contexts averaged equally; the gaps are the abortion-minus-disposal differences of the paired differences. E8a registers no direction and no decision rule; the knowledge-minus-recklessness difference is described, as registered.

Table 1-S7.10

Rating profile of the four attributed mental states in each condition, from the saved joint model

Rating	Illegal abortion			Improper disposal		
	No information	Expected evidence	Unexpected evidence	No information	Expected evidence	Unexpected evidence
Purpose	2.70 [2.36, 3.04]	5.78 [5.42, 6.13]	2.84 [2.39, 3.29]	2.48 [2.12, 2.84]	5.94 [5.62, 6.26]	2.73 [2.31, 3.16]
Knowledge	2.64 [2.30, 2.98]	5.42 [5.02, 5.83]	2.63 [2.19, 3.07]	2.68 [2.32, 3.03]	5.77 [5.46, 6.08]	2.55 [2.18, 2.91]
Recklessness	3.25 [2.86, 3.64]	5.76 [5.40, 6.13]	2.95 [2.49, 3.40]	3.20 [2.83, 3.57]	5.62 [5.25, 5.98]	3.09 [2.70, 3.48]
Negligence	3.60 [3.21, 3.98]	5.90 [5.54, 6.26]	3.37 [2.92, 3.82]	3.38 [2.99, 3.77]	5.84 [5.52, 6.16]	3.27 [2.85, 3.69]

Note. Each entry is the model-implied mean rating with its normal Wald 95% interval, from the saved main joint model of E8a: the condition intercept plus the attitude slopes at the attitude means of the participants in the model, with the reference term of the attitude means in the standard errors, as the analysis forms its comparisons. These means reproduce every saved E8a comparison. The registered description of the full rating profile; reported without a verdict.

Table 1-S7.11

Paired differences between the attributed mental states with the attitude slopes free in each condition (registered sensitivity model)

Contrast	Letter	Estimate	SE	z	p	95% CI
Within each outcome condition, legal contexts averaged equally						
Purpose – knowledge, no information	E8a	−0.09	0.10	−0.86	.389	[−0.29, 0.11]
Purpose – knowledge, expected evidence	E8a	0.27	0.08	3.40	< .001	[0.11, 0.42]
Purpose – knowledge, unexpected evidence	E8a	0.21	0.08	2.67	.008	[0.05, 0.36]
Recklessness – negligence, no information	E8a	−0.24	0.11	−2.15	.032	[−0.46, −0.02]
Recklessness – negligence, expected evidence	E8a	−0.18	0.09	−2.10	.036	[−0.35, −0.01]
Recklessness – negligence, unexpected evidence	E8a	−0.31	0.10	−3.05	.002	[−0.51, −0.11]
Knowledge – recklessness, no information	—	−0.59	0.11	−5.66	< .001	[−0.80, −0.39]
Knowledge – recklessness, expected evidence	—	−0.13	0.10	−1.25	.211	[−0.33, 0.07]
Knowledge – recklessness, unexpected evidence	—	−0.41	0.11	−3.76	< .001	[−0.63, −0.20]
Abortion minus disposal gap of each paired difference						
Purpose – knowledge, no information	E8a	0.27	0.20	1.32	.187	[−0.13, 0.66]
Purpose – knowledge, expected evidence	E8a	0.19	0.16	1.20	.228	[−0.12, 0.50]
Purpose – knowledge, unexpected evidence	E8a	0.03	0.15	0.21	.836	[−0.27, 0.33]
Recklessness – negligence, no information	E8a	−0.19	0.23	−0.85	.395	[−0.63, 0.25]
Recklessness – negligence, expected evidence	E8a	0.07	0.17	0.40	.690	[−0.27, 0.40]

Contrast	Letter	Estimate	SE	z	p	95% CI
Recklessness – negligence, unexpected evidence	E8a	−0.22	0.20	−1.09	.276	[−0.62, 0.18]

Note. The same comparisons as the table above, from the joint model with the attitude slopes estimated separately in each of the six conditions. Reported without a verdict.

Table 1-S7.12

Effects of outcome information on punishment compared with blame, responsibility and wrongness, and the outcome comparisons within each judgment

Contrast	Letter	Estimate	SE	z	p	95% CI
Effect on punishment minus effect on another judgment, legal contexts averaged equally

Expected evidence – unexpected evidence	0.49	[0.03, 0.95]	0.63	[0.10, 1.16]

Note. The same comparisons as the table above, from the joint model with the attitude slopes estimated separately in each of the six conditions and from the joint model without the attitudes. Intervals: Normal Wald, two-sided 95%. Reported without a verdict.

Table 1-S7.14

Comparisons of the negligence-minus-purpose difference across the outcome conditions, legal contexts averaged

Comparison	Letter	Predicted	Difference	95% CI	Decision
Expected evidence – no information	—	None	−0.88	[−1.21, −0.56]	reported without a verdict
Unexpected evidence – no information	—	None	−0.36	[−0.69, −0.03]	reported without a verdict
Expected evidence – unexpected evidence	E8c	Negative	−0.52	[−0.83, −0.21]	supported

Note. Differences of adjusted outcome-condition means of each participant's negligence rating minus purpose rating, each the equal-weight average of the two within-context differences, from an analysis of covariance with the four attitudes as covariates. Predicted = the registered sign of the difference (E8c: less negligence relative to purpose after expected than after unexpected evidence); the two comparisons with no information have no registered direction and are reported without a verdict.

Table 1-S7.15

Indirect effects of outcome information on blame through the four mediators, by legal context

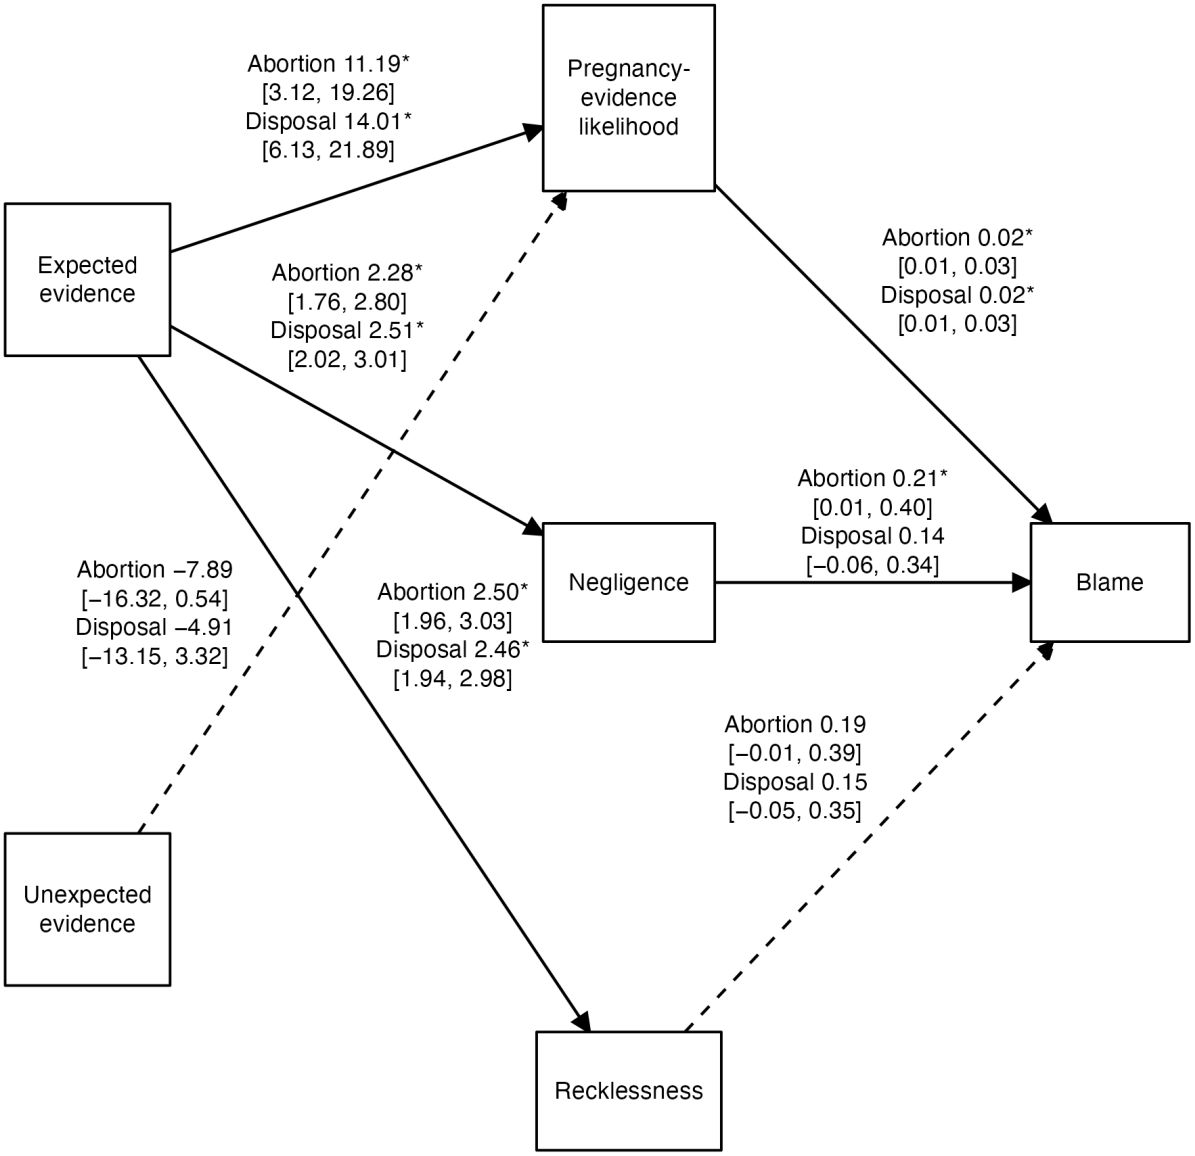

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → pregnancy-evidence likelihood → blame	E9a	0.217	[0.047, 0.442]	Positive	supported
Expected evidence → foreseeability → blame	—	0.079	[−0.014, 0.225]	None	reported without a verdict
Expected evidence → negligence → blame	E9c	0.468	[0.035, 0.995]	Positive	supported
Expected evidence → recklessness → blame	E9d	0.470	[−0.048, 1.012]	Positive	not supported
Unexpected evidence → pregnancy-evidence likelihood → blame	E9b	−0.153	[−0.360, 0.011]	Negative	not supported
Unexpected evidence → foreseeability → blame	—	−0.032	[−0.131, 0.034]	None	reported without a verdict
Unexpected evidence → negligence → blame	—	−0.043	[−0.217, 0.085]	None	reported without a verdict
Unexpected evidence → recklessness → blame	—	−0.054	[−0.239, 0.056]	None	reported without a verdict
Improper disposal					
Expected evidence → pregnancy-evidence likelihood → blame	E9a	0.300	[0.097, 0.576]	Positive	supported
Expected evidence → foreseeability → blame	—	0.042	[−0.030, 0.161]	None	reported without a verdict
Expected evidence → negligence → blame	E9c	0.350	[−0.171, 0.876]	Positive	not supported

Pathway	Letter	Estimate	95% CI	Predicted	Decision
Expected evidence → recklessness → blame	E9d	0.368	[−0.141, 0.897]	Positive	not supported
Unexpected evidence → pregnancy-evidence likelihood → blame	E9b	−0.105	[−0.299, 0.077]	Negative	not supported
Unexpected evidence → foreseeability → blame	—	−0.074	[−0.209, 0.037]	None	reported without a verdict
Unexpected evidence → negligence → blame	—	−0.012	[−0.134, 0.090]	None	reported without a verdict
Unexpected evidence → recklessness → blame	—	−0.015	[−0.136, 0.083]	None	reported without a verdict

Note. Indirect effects are products of the unstandardized outcome-to-mediator and mediator-to-blame paths, in blame points per outcome contrast. Predicted = the registered sign; the other indirect effects have no registered direction and are reported without a verdict.

Figure 1-S7.2

Fitted blame chains of the four-mediator model (E9a–E9d)

Note. E9a and E9b trace expected and unexpected evidence through pregnancy-evidence likelihood to blame. E9c traces expected evidence through negligence, and E9d traces it through recklessness. The fitted primary-sample model includes four mediators and the four attitudes. The paths give unstandardized estimates and robust (Huber–White) Wald 95% intervals in the original units. Each has separate estimates for illegal abortion and improper

disposal, labeled Abortion and Disposal. I used dashed lines only when both context intervals included zero, and solid lines otherwise. I left foreseeability out of the diagram because none of its paths has a hypothesis letter. I also omit the paths from unexpected evidence to negligence and recklessness, direct paths from outcome information to blame, attitude slopes, and mediator-disturbance covariances. The path table gives the direct paths. The indirect-effect table gives the products of the paths. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S7.16

Legal-context differences in the indirect effects and paths of the four-mediator model

Quantity	Estimate	SE	95% CI
Indirect effects, abortion minus disposal (percentile bootstrap)			
Expected evidence → pregnancy-evidence likelihood → blame	−0.083	—	[−0.408, 0.214]
Expected evidence → foreseeability → blame	0.037	—	[−0.116, 0.205]
Expected evidence → negligence → blame	0.118	—	[−0.567, 0.859]
Expected evidence → recklessness → blame	0.102	—	[−0.653, 0.865]
Unexpected evidence → pregnancy-evidence likelihood → blame	−0.047	—	[−0.326, 0.206]
Unexpected evidence → foreseeability → blame	0.042	—	[−0.108, 0.191]
Unexpected evidence → negligence → blame	−0.031	—	[−0.232, 0.141]
Unexpected evidence → recklessness → blame	−0.039	—	[−0.249, 0.125]
Paths, abortion minus disposal (robust Wald)			
Expected evidence → pregnancy-evidence likelihood	−2.816	5.755	[−14.097, 8.464]
Unexpected evidence → pregnancy-evidence likelihood	−2.977	6.014	[−14.764, 8.810]
Expected evidence → foreseeability	0.174	0.226	[−0.270, 0.617]
Unexpected evidence → foreseeability	0.217	0.216	[−0.206, 0.640]
Expected evidence → negligence	−0.231	0.366	[−0.949, 0.487]
Unexpected evidence → negligence	−0.126	0.418	[−0.944, 0.693]

Quantity	Estimate	SE	95% CI
Expected evidence → recklessness	0.036	0.380	[−0.708, 0.780]
Unexpected evidence → recklessness	−0.186	0.410	[−0.990, 0.618]
Expected evidence → blame	−0.558	0.410	[−1.361, 0.246]
Unexpected evidence → blame	−0.455	0.350	[−1.140, 0.231]
Pregnancy-evidence likelihood → blame	−0.002	0.007	[−0.015, 0.011]
Foreseeability → blame	0.006	0.184	[−0.354, 0.366]
Negligence → blame	0.066	0.143	[−0.214, 0.345]
Recklessness → blame	0.039	0.144	[−0.243, 0.320]

Note. Differences are abortion minus disposal. Indirect-effect differences: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Path differences: unstandardized, with robust (Huber–White) SE and normal Wald 95% intervals from the saved original-unit covariance. Reported without a verdict (no registered direction).

Table 1-S7.17

Unstandardized (b) and standardized (β) path estimates of the four-mediator model, by legal context

Note. Each row pairs the registered estimate (the model with the four attitude covariates, as printed in the table the band names, with its interval) with the same quantity from the registered companion model without the attitudes. Both are the saved cells of their models, in the units and with the interval procedure of the table named; that table's Note gives the model, the sample and the fit. — marks a quantity without a registered letter.

S8. RQ4: The registered mediation analyses and additional analyses

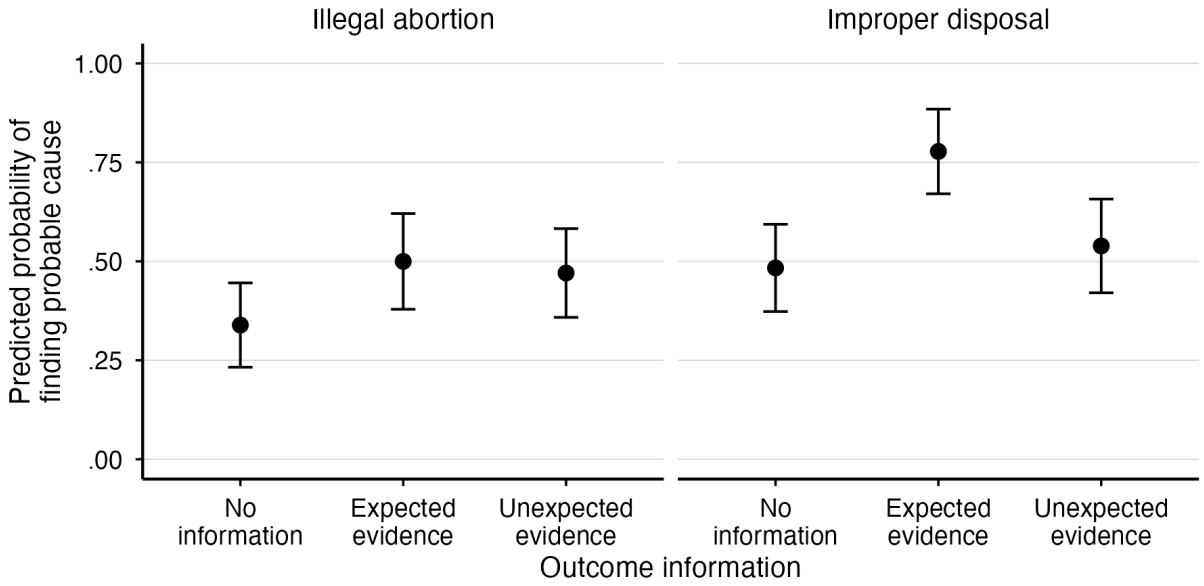

Notes shared by tables of this section.

- Tables 1-S8.1, 1-S8.2, 1-S8.5, 1-S8.7, 1-S8.10, 1-S8.13 and 1-S8.16: Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable.
- Tables 1-S8.1, 1-S8.2 and 1-S8.5: No attitude was missing, so no values were imputed.
- Tables 1-S8.1 and 1-S8.2: A letter is supported when its interval lies on the predicted side of zero.
- Tables 1-S8.1 to 1-S8.3 and 1-S8.5: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.
- Tables 1-S8.1 to 1-S8.3 and 1-S8.5 to 1-S8.18: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).
- Tables 1-S8.2 and 1-S8.3: Confidence in the chosen ruling is rated on the 0–100 scale; differences are in scale points.
- Tables 1-S8.7, 1-S8.8, 1-S8.12, 1-S8.13, 1-S8.15 and 1-S8.16: A letter is supported in a legal context when its interval lies on the predicted side of zero.
- Tables 1-S8.7 to 1-S8.18: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence; each is contrasted with no information.
- Tables 1-S8.8 and 1-S8.13: Indirect effects are products of the unstandardized paths of their route, in probit units of the ruling per outcome contrast; the abortion-minus-disposal rows are differences of those products.
- Tables 1-S8.8 and 1-S8.13: The run reports no global fit for a model with a probit endpoint (the registration names none).
- Tables 1-S8.9 and 1-S8.14: Ruling paths are in probit units (latent-response residual variance = 1); other paths are unstandardized in their original units.
- Tables 1-S8.9 and 1-S8.14: WLSMV: robust standard errors, two-sided normal Wald 95% intervals, and two-sided p values.
- Tables 1-S8.10 and 1-S8.16: Indirect effects are in confidence points (0–100 scale) per outcome contrast.

- Tables 1-S8.17 and 1-S8.18: Joint 95% percentile bootstrap bands (type 6) for each comparison's two curves used 10,000 participant resamples within the six conditions (9,983 usable).
- Tables 1-S8.17 and 1-S8.18: Reported without a verdict (no registered decision rule).

Figure 1-S8.1

Predicted probability of finding probable cause after each kind of outcome information, by legal context

Note. I used the primary-sample probit model to predict each participant's probable cause ruling in every condition, retaining that participant's attitudes. The points average these marginaleffects predictions. The bars give two-sided 95% delta-method intervals based on the model's robust covariance. The intervals are symmetric on the probability scale and can extend beyond its limits. The registered comparisons and their percentile bootstrap intervals are in the tables. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S8.1

Differences in the probability of finding probable cause between outcome conditions and between legal contexts

Comparison	Letter	Predicted	Difference	95% CI	Decision
Outcome comparisons, legal contexts averaged					
Expected evidence – no information	H4a	Positive	.228	[.117, .337]	supported
Expected evidence – unexpected evidence	E10a	Positive	.134	[.020, .249]	supported
Unexpected evidence – no information	E10b	Positive	.094	[−.022, .208]	not supported
Legal-context comparisons, outcome conditions weighted equally					
Illegal abortion – improper disposal, outcome conditions weighted equally	—	None	−.163	[−.259, −.070]	reported without a verdict
Expected evidence – no information, illegal abortion minus improper disposal	—	None	−.133	[−.352, .089]	reported without a verdict
Unexpected evidence – no information, illegal abortion minus improper disposal	—	None	.076	[−.147, .306]	reported without a verdict

Note. Differences between average predicted probabilities of a probable-cause ruling from the saved probit, each probability averaged over every participant of the sample predicted in the condition; the legal-context rows compare the two contexts averaged over the outcome conditions, and the differences in the effect of each kind of evidence between the contexts. H4a is the registered hypothesis of the manuscript; E10a–E10b and the legal-context rows are exploratory. Predicted = the registered sign of the difference; the legal-context comparisons have no registered direction and are reported without a verdict. Probabilities and their differences are in probability units.

Table 1-S8.2

Adjusted-mean differences in confidence in the chosen ruling between outcome conditions and between legal contexts

Comparison	Letter	Predicted	Difference	95% CI	Decision
Outcome comparisons, legal contexts averaged					
Expected evidence – no information	E10c	Positive	5.06	[0.29, 9.61]	supported
Expected evidence – unexpected evidence	—	None	1.32	[−3.57, 6.22]	reported without a verdict
Unexpected evidence – no information	E10d	Positive	3.75	[−1.06, 8.32]	not supported
Legal-context comparisons, outcome conditions weighted equally					
Illegal abortion – improper disposal, outcome conditions weighted equally	—	None	−0.99	[−4.76, 2.89]	reported without a verdict
Expected evidence – no information, illegal abortion minus improper disposal	—	None	1.33	[−7.56, 10.35]	reported without a verdict
Unexpected evidence – no information, illegal abortion minus improper disposal	—	None	12.30	[3.08, 21.73]	reported without a verdict

Note. Differences of adjusted condition means of confidence from the saved analysis of covariance with the four attitudes as covariates (common slopes), each outcome comparison the equal-weight average of the two within-context differences; the legal-context rows compare the two contexts averaged over the outcome conditions, and the differences in the effect of each kind of evidence between the contexts. Predicted = the registered sign of the difference; the comparison of expected with unexpected evidence and the legal-context comparisons have no registered direction and are reported without a verdict.

Table 1-S8.3

Adjusted condition means of confidence in the chosen ruling

	Illegal abortion		Improper disposal		Both contexts (equal weights)
Condition	**M**	**n**	**M**	**n**	**M**
No information	72.16	68	77.69	71	74.92
Expected evidence	77.89	63	82.09	66	79.99
Unexpected evidence	82.06	63	75.28	67	78.67

Note. Adjusted means of confidence from the saved analysis of covariance, at the attitude means of the participants in the model; n = participants in the condition. The context-averaged column weights the two contexts equally; its differences are the registered outcome comparisons above.

Table 1-S8.4

Source table of the analysis of covariance of confidence in the chosen ruling

Source	F	df1	df2	p	Partial η^2	90% CI
Legal context	0.30	1	388	.587	.001	[.000, 1.000]
Outcome information	2.36	2	388	.096	.012	[.000, 1.000]
Abortion attitudes	0.54	1	388	.464	.001	[.000, 1.000]
Support for punishment	1.37	1	388	.242	.004	[.000, 1.000]
Hostile sexism	0.00	1	388	.945	.000	[.000, 1.000]
Benevolent sexism	0.03	1	388	.866	.000	[.000, 1.000]
Legal context × outcome information	3.92	2	388	.021	.020	[.004, 1.000]

Note. Analysis of Covariance (ANCOVA) with the four attitudes as covariates. Type-II F-tests. Partial η^2 = partial eta-squared (η^2_p) with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. A standard decomposition reported for its effect sizes; the registered tests are the comparisons and their bootstrap intervals, not these F tests.

Table 1-S8.5

Joint predictors of the original probable-cause ruling (E11a), by legal context

	Illegal abortion		Improper disposal	
Predictor	**b**	**95% CI**	**b**	**95% CI**
Outcome information				
Expected evidence (vs. no information)	−0.3562	[−1.0567, 0.2906]	0.0178	[−0.8339, 0.9305]
Unexpected evidence (vs. no information)	0.7552	[0.2119, 1.5761]	0.3377	[−0.2738, 1.0531]
Judgments				
Pregnancy-evidence likelihood	0.0071	[−0.0035, 0.0203]	0.0199	[0.0078, 0.0391]
Foreseeability	0.3736	[0.1167, 0.7062]	0.4318	[0.1566, 0.8624]
Evidence relevance (ten-item mean)	0.1094	[−0.0297, 0.2891]	0.0625	[−0.0861, 0.2395]
Negligence	0.2491	[0.0917, 0.4863]	0.1581	[0.0142, 0.3468]
Suspect blame	0.1619	[0.0210, 0.3410]	0.1598	[0.0026, 0.3486]
Attitudes				
Abortion attitudes	0.0066	[−0.0056, 0.0216]	0.0099	[−0.0021, 0.0242]
Support for punishment	0.0288	[−0.1924, 0.2396]	0.2362	[0.0553, 0.4854]
Hostile sexism	−0.1248	[−0.4017, 0.1156]	−0.1041	[−0.3963, 0.1762]
Benevolent sexism	0.1044	[−0.1762, 0.3926]	−0.2732	[−0.6279, −0.0521]

Note. Unstandardized probit slopes of a probable-cause ruling on all predictors at once, estimated separately in each legal context; each is a conditional association with the other predictors held constant. Reported without a verdict (no registered direction or decision rule). Probit slopes, in probit units per scale point of each predictor: pregnancy-evidence likelihood (0–100), foreseeability (1–5), evidence relevance (1–9, the ten-item mean), negligence (1–7), suspect blame (1–7), abortion attitudes (14–98, the item sum), support for punishment (1–7), hostile and benevolent sexism (0–5); the outcome indicators compare each kind of evidence with no information.

Table 1-S8.6

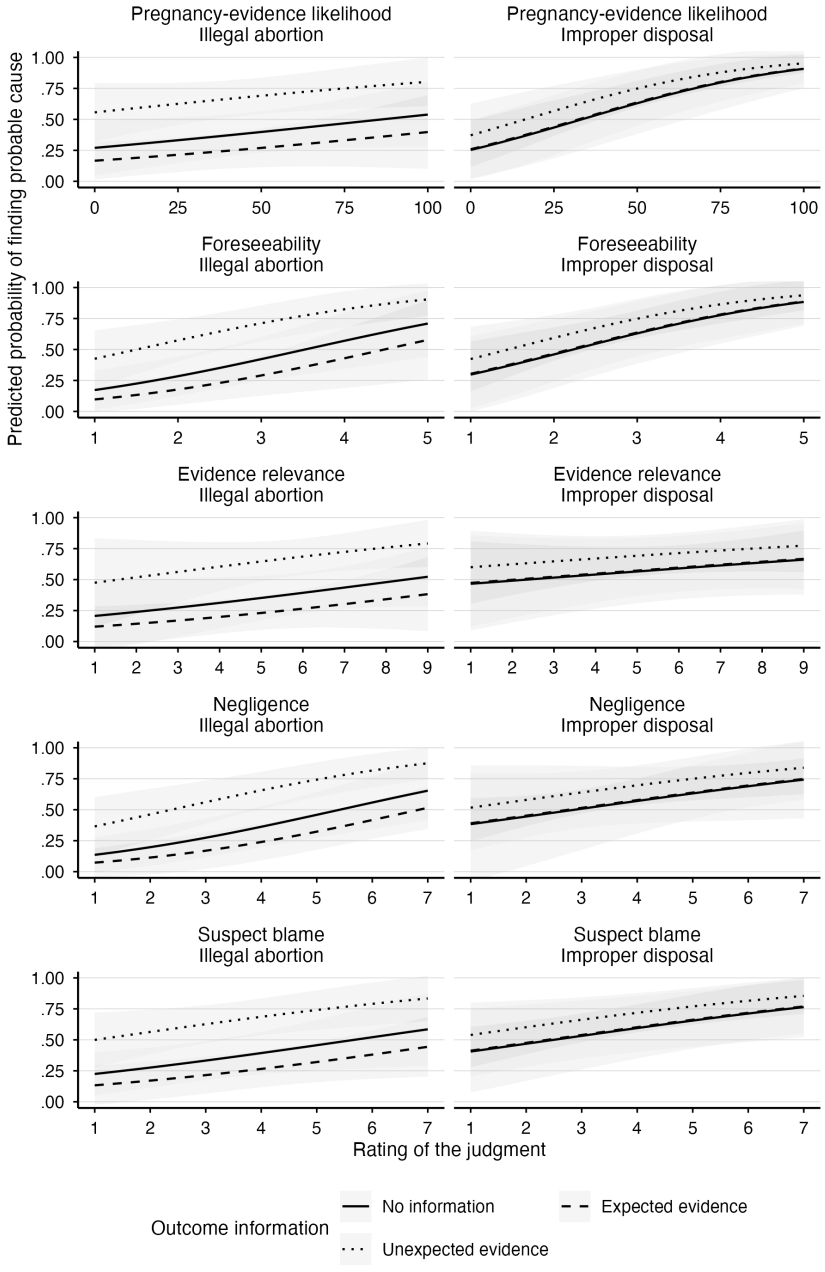

Thresholds of the joint probit model in each legal context

Model	Illegal abortion	Improper disposal
With the four attitudes (registered)	4.364	3.886
Without attitudes (registered companion)	3.980	3.426

Note. The threshold of the latent response in each legal context (probit units, residual variance fixed at one), with every predictor at zero; the registration reports the thresholds without an interval. The predictors are not centered, so the thresholds are not probabilities at the sample means.

Figure 1-S8.2

Predicted probability of finding probable cause across each judgment in the joint model, by legal context and outcome information

Note. Predicted probabilities of a probable cause ruling from the joint probit model with the attitudes in the primary sample. I varied one judgment across its observed range in each

panel, holding the other four judgments and four attitudes at the means of all participants in the model. Evidence relevance is the observed ten-item mean. I evaluated predictions on a fixed grid and used the robust covariance to obtain two-sided 95% delta-method bands, truncating the symmetric probability-scale intervals at 0 and 1. The table above reports the slopes with percentile bootstrap intervals. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S8.7

Serial indirect effects of outcome information on scalar probable cause–confidence, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4b	−1.471	[−3.659, −0.277]	Positive	not supported
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4c	−1.160	[−3.190, −0.027]	Negative	supported
Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4d	−0.312	[−1.880, 0.896]	Positive	not supported

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Expected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	−0.014	[−0.477, 0.417]	None	reported without a verdict
Expected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	12.747	[5.437, 21.538]	None	reported without a verdict
Expected evidence → foreseeability → scalar probable cause–confidence	—	6.923	[1.248, 14.079]	None	reported without a verdict
Unexpected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	−0.0005	[−0.417, 0.439]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	−4.723	[−11.574, 0.745]	None	reported without a verdict
Unexpected evidence → foreseeability → scalar probable cause–confidence	—	−6.763	[−13.510, −1.328]	None	reported without a verdict
Improper disposal					
Expected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4b	−0.982	[−2.539, 0.129]	Positive	not supported

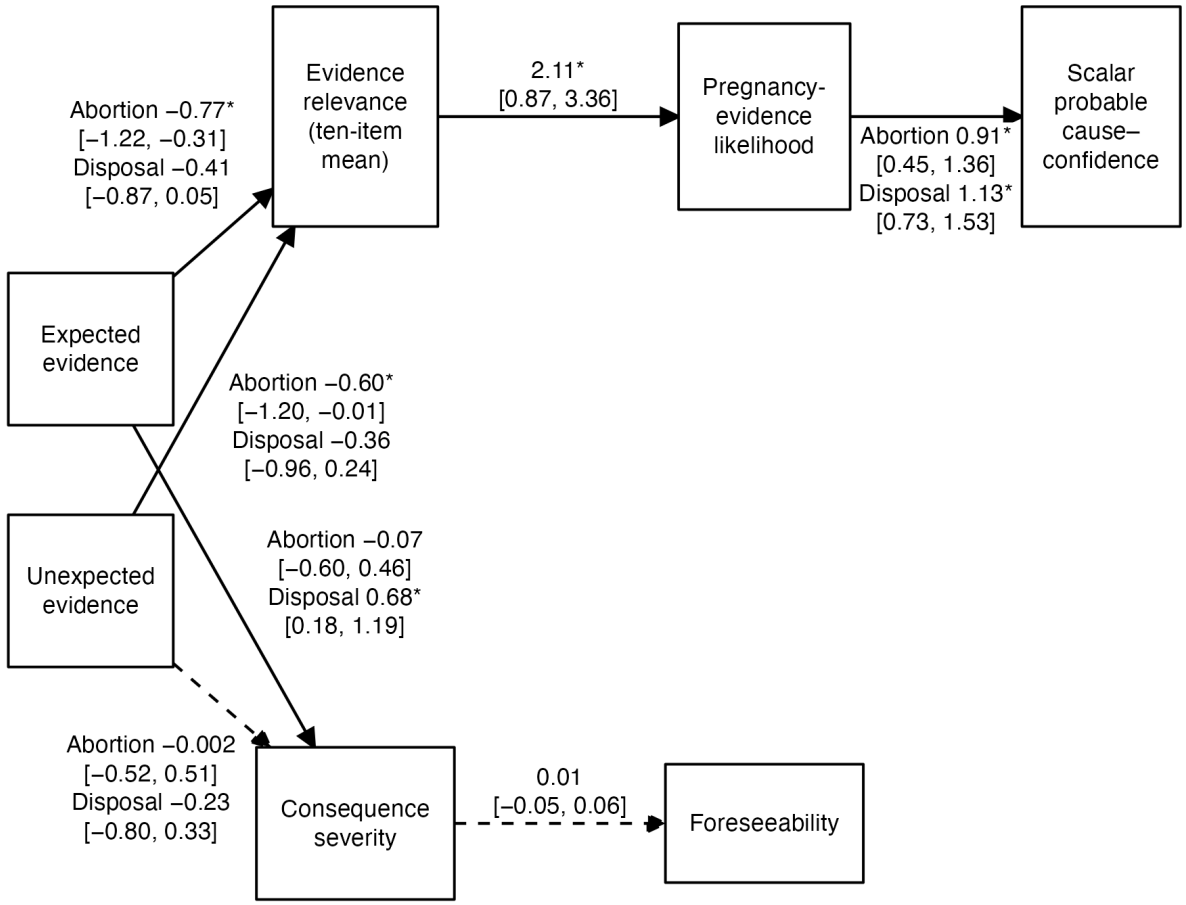

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4c	−0.858	[−2.841, 0.513]	Negative	not supported
Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	H4d	−0.124	[−1.820, 1.658]	Positive	not supported
Expected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	0.122	[−0.893, 1.019]	None	reported without a verdict
Expected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	15.862	[7.959, 25.684]	None	reported without a verdict
Expected evidence → foreseeability → scalar probable cause–confidence	—	6.028	[1.055, 12.561]	None	reported without a verdict
Unexpected evidence → consequence severity → foreseeability → scalar probable cause–confidence	—	−0.042	[−0.582, 0.397]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood → scalar probable cause–confidence	—	−5.877	[−13.388, 0.962]	None	reported without a verdict

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → foreseeability → scalar probable cause–confidence	—	−5.888	[−12.045, −1.122]	None	reported without a verdict

Note. Registered quantities first: the serial indirect effects through evidence relevance and then pregnancy-evidence likelihood (H4b–H4d); the foreseeability and likelihood-only pathways follow, reported without a registered direction. Indirect effects are products of the unstandardized paths of their route, in scalar probable cause–confidence points (−100 to 100) per outcome contrast. Scalar probable cause–confidence is the confidence rating when the participant found probable cause and its negative when they did not. Global fit: Table 1-S4.23 (registered model).

Figure 1-S8.3

Fitted hypothesized chains of the registered serial model (H4b–H4d)

Note. H4b and H4c trace expected and unexpected evidence through evidence relevance and pregnancy-evidence likelihood to scalar probable cause confidence. H4d is the difference between these indirect effects. The registered primary-sample model uses the ten-item mean for relevance. I retained the H1 route through consequence severity to foreseeability. Path labels give unstandardized estimates in the original units, with robust (Huber–White) Wald 95% intervals. The paths from outcome information to each mediator and from likelihood to the outcome have separate estimates for illegal abortion and improper disposal, labeled Abortion and Disposal. Both contexts share the relevance-to-likelihood and severity-to-foreseeability estimates. Solid lines indicate intervals excluding zero; dashed lines indicate intervals including it. I dash a path with two estimates only when both intervals include zero. The path table gives the omitted direct paths from outcome information to likelihood, foreseeability, and the outcome, the foreseeability-to-outcome path, attitude

slopes, and disturbance covariances. The indirect-effect table gives the products of the paths. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S8.8

Indirect effects of outcome information on the probable-cause ruling through evidence relevance, severity, likelihood and foreseeability, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → evidence relevance → pregnancy-evidence likelihood → probable-cause ruling	E12a	−0.0552	[−0.1513, −0.0153]	Positive	not supported

Expected minus unexpected evidence → consequence severity → foreseeability → probable-cause ruling	—	−0.0092	[−0.0419, 0.0373]	None	reported without a verdict

Note. Registered quantities first in each legal context: the serial indirect effects through evidence relevance and pregnancy-evidence likelihood (E12a–E12c); the other pathways, their totals and the abortion-minus-disposal differences are reported without a registered direction. I calculated the two-sided 95% percentile bootstrap intervals using type 6 quantiles from participant resamples within the six conditions. Of 10,000 attempts, 9,919 were usable. No item was missing.

The endpoint coefficients of the relevance pathway model of the probable-cause ruling, with their registered percentile bootstrap intervals, are in Table 1-S8.9 (the Bootstrap interval columns).

Figure 1-S8.4

Fitted relevance chain of the probable-cause ruling (E12a–E12c)

Note. E12a and E12b trace expected and unexpected evidence through evidence relevance and pregnancy-evidence likelihood to the probable cause ruling. E12c is the difference between these indirect effects. I show these pathways from the fitted registered model with the four attitudes in the primary sample. Path labels give unstandardized estimates in the original units, with the ruling's endpoint path in probit units. The coefficient table gives registered percentile bootstrap intervals for the paths into the ruling. The path table gives robust Wald intervals for every path. The paths from outcome information to relevance and from likelihood to the ruling have separate estimates for illegal abortion and improper disposal, labeled Abortion and Disposal. Both contexts share the relevance-to-likelihood estimate. I draw every path as a solid line. I omit the severity route, direct paths, attitude slopes, and disturbance covariances. The path table gives the direct paths. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Expected minus unexpected evidence → consequence severity → foreseeability → confidence in the ruling	E12d	−0.001	[−0.076, 0.101]
Illegal abortion minus improper disposal			
Expected evidence → evidence relevance → pregnancy-evidence likelihood → confidence in the ruling	E12d	0.101	[−0.110, 0.394]
Expected evidence → consequence severity → foreseeability → confidence in the ruling	E12d	0.002	[−0.087, 0.074]
Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → confidence in the ruling	E12d	0.084	[−0.097, 0.377]
Unexpected evidence → consequence severity → foreseeability → confidence in the ruling	E12d	−0.0002	[−0.052, 0.061]
Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → confidence in the ruling	E12d	0.017	[−0.160, 0.181]
Expected minus unexpected evidence → consequence severity → foreseeability → confidence in the ruling	E12d	0.002	[−0.110, 0.090]

Note. E12d has no registered direction: every quantity is reported without a verdict. Global fit of the registered model: scaled $\chi^2(30) = 27.99$, $p = .571$; robust CFI = 1.000; robust RMSEA = .000, 90% CI [.000, .050]; SRMR = .028.

The endpoint coefficients of the relevance pathway model of confidence are the confidence-in-the-ruling equation of Table 1-S8.11, with the same robust Wald intervals; they carry no registered direction or verdict.

Figure 1-S8.5

Fitted relevance and severity chains of confidence in the ruling (E12d)

Note. The figure shows the fitted registered model with the four attitudes in the primary sample. E12d covers two chains. One runs from the evidence to evidence relevance, then to pregnancy-evidence likelihood, and then to confidence in the ruling. The other runs from the evidence to consequence severity, then to foreseeability, and then to confidence. Each path shows its unstandardized estimate and robust (Huber–White) Wald 95% interval in the original units. The paths from the evidence to each mediator and the paths into confidence are estimated in each legal context and show both estimates, labeled Abortion (illegal abortion) and Disposal (improper disposal). The path from relevance to likelihood and the path from severity to foreseeability are the same in both contexts. Solid paths have intervals that exclude zero, and dashed paths have intervals that include zero. A path with two estimates is dashed only when both intervals include zero. The figure omits the direct paths, the attitude slopes, and the disturbance covariances. The path table reports the direct paths. Expected

evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Support for punishment	−0.339 (1.088)	[−2.471, 1.792]	.755	−0.027	2.087 (1.131)	[−0.130, 4.303]	.065	0.155	No
Hostile sexism	0.495 (1.181)	[−1.819, 2.809]	.675	0.034	−0.276 (1.255)	[−2.736, 2.183]	.826	−0.019	No
Benevolent sexism	0.297 (1.372)	[−2.393, 2.987]	.829	0.019	0.186 (1.162)	[−2.093, 2.464]	.873	0.011	No

Note. Inference and decisions use the unstandardized paths in their original units. I include β (std.all) to show each path on a standardized scale. For the unstandardized paths, the MLR fit's Huber–White sandwich supplies robust standard errors, two-sided normal Wald 95% intervals, and two-sided p values. Table 1-S4.3 supplies the equations for evidence relevance, consequence severity, pregnancy-evidence likelihood, and foreseeability and their disturbance covariances. Those cells are identical here.

Table 1-S8.12

Mediator and endpoint paths of the two-mediator model of the probable-cause ruling, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Pregnancy-evidence likelihood → probable-cause ruling	E13a	0.0175	[0.0095, 0.0290]	Positive	supported
Foreseeability → probable-cause ruling	E13b	0.4617	[0.2408, 0.7397]	Positive	supported
Expected evidence → probable-cause ruling	E13g	0.1820	[−0.3596, 0.7437]	Positive	not supported
Unexpected evidence → probable-cause ruling	E13h	0.6674	[0.1947, 1.2526]	Positive	supported
Expected evidence → pregnancy-evidence likelihood	—	11.1912	[3.3437, 19.3916]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood	—	−7.8901	[−16.1344, 0.7255]	None	reported without a verdict
Expected evidence → foreseeability	—	0.3866	[0.0597, 0.7125]	None	reported without a verdict
Unexpected evidence → foreseeability	—	−0.1550	[−0.4559, 0.1453]	None	reported without a verdict
Improper disposal					
Pregnancy-evidence likelihood → probable-cause ruling	E13a	0.0266	[0.0163, 0.0422]	Positive	supported
Foreseeability → probable-cause ruling	E13b	0.5210	[0.2757, 0.8521]	Positive	supported
Expected evidence → probable-cause ruling	E13g	0.7191	[0.1493, 1.4348]	Positive	supported

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → probable-cause ruling	E13h	0.5330	[−0.0064, 1.1479]	Positive	not supported
Expected evidence → pregnancy-evidence likelihood	—	14.0074	[5.8351, 21.9513]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood	—	−4.9130	[−13.2011, 3.2933]	None	reported without a verdict
Expected evidence → foreseeability	—	0.2127	[−0.0982, 0.5203]	None	reported without a verdict
Unexpected evidence → foreseeability	—	−0.3721	[−0.6831, −0.0569]	None	reported without a verdict

Note. The likelihood and foreseeability slopes on the ruling (E13a–E13b) and the direct outcome paths (E13g–E13h) precede the outcome-to-mediator paths, for which I registered no direction. Endpoint coefficients express change in probit units per predictor unit; the residual variance of the latent response is fixed at one. I used the registered two-sided 95% percentile bootstrap intervals, taking type 6 quantiles of participant resamples drawn within the six conditions. All 10,000 attempts were usable. No item was missing.

Table 1-S8.13

Indirect effects of outcome information on the probable-cause ruling through likelihood and foreseeability, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → pregnancy-evidence likelihood → probable-cause ruling	E13c	0.1958	[0.0527, 0.4189]	Positive	supported

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → pregnancy-evidence likelihood → probable-cause ruling	E13d	−0.1380	[−0.3542, 0.0126]	Negative	not supported
Unexpected evidence → foreseeability → probable-cause ruling	E13e	−0.0715	[−0.2368, 0.0710]	Negative	not supported
Unexpected evidence → sum of the two indirect effects	E13f	−0.2096	[−0.5012, 0.0355]	Negative	not supported
Expected evidence → foreseeability → probable-cause ruling	—	0.1785	[0.0234, 0.4066]	None	reported without a verdict
Expected evidence → sum of the two indirect effects	—	0.3743	[0.1263, 0.7262]	None	reported without a verdict
Expected evidence → likelihood minus foreseeability indirect effect	—	0.0173	[−0.2122, 0.2478]	None	reported without a verdict
Expected evidence → total (both indirect effects and the direct path)	—	0.5563	[0.0163, 1.1842]	None	reported without a verdict
Unexpected evidence → likelihood minus foreseeability indirect effect	—	−0.0665	[−0.2840, 0.1159]	None	reported without a verdict
Unexpected evidence → total (both indirect effects and the direct path)	—	0.4578	[−0.0869, 1.1055]	None	reported without a verdict
Expected minus unexpected evidence → pregnancy-evidence likelihood → probable-cause ruling	—	0.3338	[0.1396, 0.6415]	None	reported without a verdict

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Expected minus unexpected evidence → foreseeability → probable-cause ruling	—	0.2500	[0.0789, 0.4937]	None	reported without a verdict
Expected minus unexpected evidence → sum of the two indirect effects	—	0.5838	[0.2902, 1.0184]	None	reported without a verdict
Improper disposal					
Expected evidence → pregnancy-evidence likelihood → probable-cause ruling	E13c	0.3723	[0.1379, 0.7138]	Positive	supported
Unexpected evidence → pregnancy-evidence likelihood → probable-cause ruling	E13d	−0.1306	[−0.3915, 0.0987]	Negative	not supported
Unexpected evidence → foreseeability → probable-cause ruling	E13e	−0.1939	[−0.4453, −0.0277]	Negative	supported
Unexpected evidence → sum of the two indirect effects	E13f	−0.3244	[−0.7336, 0.0156]	Negative	not supported
Expected evidence → foreseeability → probable-cause ruling	—	0.1108	[−0.0523, 0.3166]	None	reported without a verdict
Expected evidence → sum of the two indirect effects	—	0.4831	[0.1599, 0.9184]	None	reported without a verdict
Expected evidence → likelihood minus foreseeability indirect effect	—	0.2615	[−0.0148, 0.6108]	None	reported without a verdict
Expected evidence → total (both indirect effects and the direct path)	—	1.2022	[0.5534, 2.0823]	None	reported without a verdict

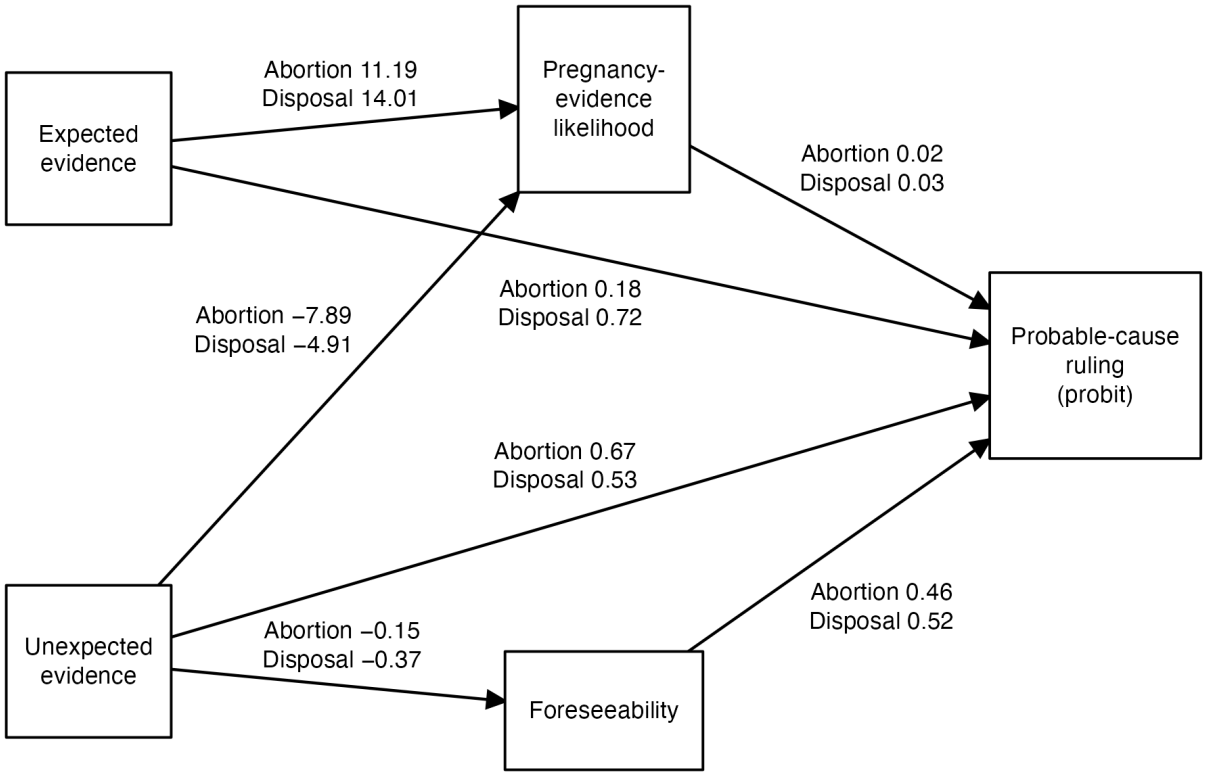

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → likelihood minus foreseeability indirect effect	—	0.0633	[−0.1868, 0.3181]	None	reported without a verdict
Unexpected evidence → total (both indirect effects and the direct path)	—	0.2086	[−0.4322, 0.8697]	None	reported without a verdict
Expected minus unexpected evidence → pregnancy-evidence likelihood → probable-cause ruling	—	0.5029	[0.2455, 0.8933]	None	reported without a verdict
Expected minus unexpected evidence → foreseeability → probable-cause ruling	—	0.3047	[0.1173, 0.5883]	None	reported without a verdict
Expected minus unexpected evidence → sum of the two indirect effects	—	0.8076	[0.4537, 1.3218]	None	reported without a verdict
Illegal abortion minus improper disposal					
Expected evidence → pregnancy-evidence likelihood → probable-cause ruling	—	−0.1765	[−0.5516, 0.1490]	None	reported without a verdict
Expected evidence → foreseeability → probable-cause ruling	—	0.0677	[−0.1842, 0.3495]	None	reported without a verdict
Expected evidence → sum of the two indirect effects	—	−0.1089	[−0.6074, 0.3748]	None	reported without a verdict
Expected evidence → likelihood minus foreseeability indirect effect	—	−0.2442	[−0.6495, 0.1112]	None	reported without a verdict

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → pregnancy-evidence likelihood → probable-cause ruling	—	−0.0074	[−0.3185, 0.2908]	None	reported without a verdict
Unexpected evidence → foreseeability → probable-cause ruling	—	0.1223	[−0.1092, 0.4103]	None	reported without a verdict
Unexpected evidence → sum of the two indirect effects	—	0.1149	[−0.3360, 0.5958]	None	reported without a verdict
Unexpected evidence → likelihood minus foreseeability indirect effect	—	−0.1298	[−0.4622, 0.1710]	None	reported without a verdict

Note. E13c–E13f appear first within each legal context. The other indirect effects, their sums, differences, and totals, and the expected-minus-unexpected and abortion-minus-disposal comparisons have no registered direction.

Figure 1-S8.6

Fitted two-mediator chains of the probable-cause ruling (E13a–E13h)

Note. Fitted parallel mediation model of outcome information and the probable cause ruling in the primary sample, with likelihood and foreseeability as mediators and the four attitudes as covariates. The likelihood and foreseeability coefficients on the ruling are E13a and E13b. Indirect effects of expected and unexpected evidence through likelihood are E13c and E13d; for unexpected evidence, the indirect effect through foreseeability is E13e and the sum across both mediators is E13f. E13g and E13h are the direct effects of outcome information. Unstandardized estimates are shown separately for illegal abortion (Abortion) and improper disposal (Disposal). Estimates for paths into the ruling are in probit units; all others are in their original units. All paths are solid. The coefficient table reports registered percentile bootstrap intervals for every path, and the path table reports robust Wald intervals. The path table also includes the unlettered expected-evidence path to foreseeability, attitude slopes,

and mediator-disturbance covariance omitted from the diagram. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S8.14

Unstandardized path estimates of the two-mediator model of the probable-cause ruling, by legal context

	Illegal abortion			Improper disposal			
Predictor	**b (SE)**	**95% CI**	**p**	**b (SE)**	**95% CI**	**p**	**Equal across contexts**

Note. The registered intervals of the endpoint paths are the percentile bootstrap intervals of the coefficient table.

Table 1-S8.15

Mediator and endpoint paths of the two-mediator model of confidence, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Pregnancy-evidence likelihood → confidence in the ruling	E13i	−0.033	[−0.133, 0.068]	Positive	not supported
Foreseeability → confidence in the ruling	E13j	−1.771	[−5.243, 1.701]	Positive	not supported
Expected evidence → confidence in the ruling	E13o	6.910	[0.167, 13.653]	Positive	supported
Unexpected evidence → confidence in the ruling	E13p	9.461	[3.300, 15.623]	Positive	supported
Expected evidence → pregnancy-evidence likelihood	—	11.191	[3.121, 19.261]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood	—	−7.890	[−16.325, 0.545]	None	reported without a verdict
Expected evidence → foreseeability	—	0.387	[0.063, 0.710]	None	reported without a verdict
Unexpected evidence → foreseeability	—	−0.155	[−0.450, 0.140]	None	reported without a verdict
Improper disposal					
Pregnancy-evidence likelihood → confidence in the ruling	E13i	0.056	[−0.065, 0.178]	Positive	not supported
Foreseeability → confidence in the ruling	E13j	−0.122	[−2.858, 2.615]	Positive	not supported
Expected evidence → confidence in the ruling	E13o	3.272	[−3.522, 10.066]	Positive	not supported
Unexpected evidence → confidence in the ruling	E13p	−2.555	[−9.464, 4.354]	Positive	not supported

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Expected evidence → pregnancy-evidence likelihood	—	14.007	[6.126, 21.889]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood	—	−4.913	[−13.147, 3.321]	None	reported without a verdict
Expected evidence → foreseeability	—	0.213	[−0.091, 0.516]	None	reported without a verdict
Unexpected evidence → foreseeability	—	−0.372	[−0.675, −0.069]	None	reported without a verdict

Note. Row order: E13i–E13j, E13o–E13p, then outcome-to-mediator paths (no registered direction). Coefficients are unstandardized, in response units per predictor unit; 95% CIs are two-sided normal Wald intervals from robust (Huber–White) covariance.

Table 1-S8.16

Indirect effects of outcome information on confidence through likelihood and foreseeability, by legal context

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Illegal abortion					
Expected evidence → pregnancy-evidence likelihood → confidence in the ruling	E13k	−0.364	[−1.609, 0.989]	Positive	not supported
Unexpected evidence → pregnancy-evidence likelihood → confidence in the ruling	E13l	0.256	[−0.744, 1.408]	Negative	not supported
Unexpected evidence → foreseeability → confidence in the ruling	E13m	0.274	[−0.457, 1.488]	Negative	not supported

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → sum of the two indirect effects	E13n	0.531	[−0.498, 1.883]	Negative	not supported
Expected evidence → foreseeability → confidence in the ruling	—	−0.685	[−2.693, 0.652]	None	reported without a verdict
Expected evidence → sum of the two indirect effects	—	−1.048	[−2.938, 0.408]	None	reported without a verdict
Expected evidence → likelihood minus foreseeability indirect effect	—	0.321	[−1.744, 3.151]	None	reported without a verdict
Expected evidence → total (both indirect effects and the direct path)	—	5.862	[−0.987, 12.479]	None	reported without a verdict
Unexpected evidence → likelihood minus foreseeability indirect effect	—	−0.018	[−1.825, 1.425]	None	reported without a verdict
Unexpected evidence → total (both indirect effects and the direct path)	—	9.992	[3.748, 16.176]	None	reported without a verdict
Expected minus unexpected evidence → pregnancy-evidence likelihood → confidence in the ruling	—	−0.620	[−2.663, 1.596]	None	reported without a verdict
Expected minus unexpected evidence → foreseeability → confidence in the ruling	—	−0.959	[−3.462, 0.866]	None	reported without a verdict
Expected minus unexpected evidence → sum of the two indirect effects	—	−1.579	[−3.975, 0.505]	None	reported without a verdict

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Improper disposal					
Expected evidence → pregnancy-evidence likelihood → confidence in the ruling	E13k	0.790	[−0.906, 2.864]	Positive	not supported
Unexpected evidence → pregnancy-evidence likelihood → confidence in the ruling	E13l	−0.277	[−1.395, 0.493]	Negative	not supported
Unexpected evidence → foreseeability → confidence in the ruling	E13m	0.045	[−1.105, 1.376]	Negative	not supported
Unexpected evidence → sum of the two indirect effects	E13n	−0.232	[−1.520, 1.027]	Negative	not supported
Expected evidence → foreseeability → confidence in the ruling	—	−0.026	[−0.833, 0.759]	None	reported without a verdict
Expected evidence → sum of the two indirect effects	—	0.764	[−0.817, 2.730]	None	reported without a verdict
Expected evidence → likelihood minus foreseeability indirect effect	—	0.815	[−1.258, 3.284]	None	reported without a verdict
Expected evidence → total (both indirect effects and the direct path)	—	4.036	[−2.714, 10.194]	None	reported without a verdict
Unexpected evidence → likelihood minus foreseeability indirect effect	—	−0.322	[−2.348, 1.213]	None	reported without a verdict
Unexpected evidence → total (both indirect effects and the direct path)	—	−2.787	[−9.835, 3.932]	None	reported without a verdict

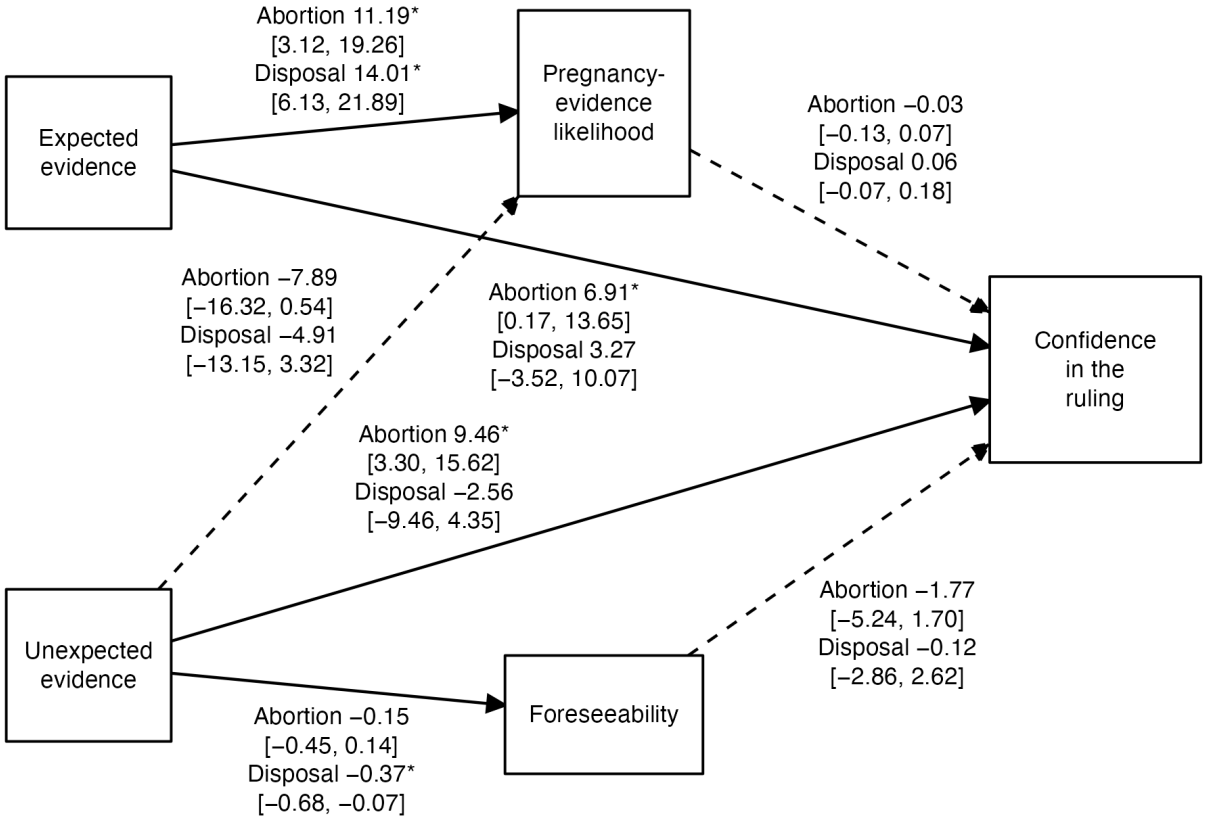

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Expected minus unexpected evidence → pregnancy-evidence likelihood → confidence in the ruling	—	1.067	[−1.235, 3.584]	None	reported without a verdict
Expected minus unexpected evidence → foreseeability → confidence in the ruling	—	−0.071	[−1.893, 1.629]	None	reported without a verdict
Expected minus unexpected evidence → sum of the two indirect effects	—	0.995	[−1.314, 3.397]	None	reported without a verdict
Illegal abortion minus improper disposal					
Expected evidence → pregnancy-evidence likelihood → confidence in the ruling	—	−1.153	[−3.455, 0.999]	None	reported without a verdict
Expected evidence → foreseeability → confidence in the ruling	—	−0.659	[−2.794, 0.879]	None	reported without a verdict
Expected evidence → sum of the two indirect effects	—	−1.812	[−4.492, 0.379]	None	reported without a verdict
Expected evidence → likelihood minus foreseeability indirect effect	—	−0.495	[−3.651, 2.909]	None	reported without a verdict
Unexpected evidence → pregnancy-evidence likelihood → confidence in the ruling	—	0.533	[−0.738, 2.047]	None	reported without a verdict
Unexpected evidence → foreseeability → confidence in the ruling	—	0.229	[−1.327, 1.816]	None	reported without a verdict

Quantity	Letter	Estimate	95% CI	Predicted	Decision
Unexpected evidence → sum of the two indirect effects	—	0.763	[−0.897, 2.549]	None	reported without a verdict
Unexpected evidence → likelihood minus foreseeability indirect effect	—	0.304	[−1.997, 2.754]	None	reported without a verdict

Note. Registered quantities first in each legal context (E13k–E13n); the other indirect effects, their sums, differences and totals, the expected-minus-unexpected comparisons and the abortion-minus-disposal differences are reported without a registered direction. The model has as many parameters as observed moments, so it has no global fit.

Figure 1-S8.7

Fitted two-mediator chains of confidence in the ruling (E13i–E13p)

Note. Fitted parallel mediation model of outcome information and confidence in the ruling in the primary sample, with likelihood and foreseeability as mediators and the four attitudes as covariates. The likelihood and foreseeability coefficients on confidence are E13i and E13j. Indirect effects of expected and unexpected evidence through likelihood are E13k and E13l; for unexpected evidence, the indirect effect through foreseeability is E13m and the sum across both mediators is E13n. E13o and E13p are the direct effects of outcome information. Each path has an unstandardized estimate and robust (Huber–White) Wald 95% interval in the original units for illegal abortion (Abortion) and improper disposal (Disposal). Solid lines indicate that an interval excludes zero in at least one legal context; dashed lines indicate that both intervals include zero. The path table reports the unlettered expected-evidence path to foreseeability, attitude slopes, and mediator-disturbance covariance, which

are omitted from the diagram. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

The paths of the two-mediator model of confidence are printed elsewhere, cell for cell: its likelihood and foreseeability equations and their disturbance covariance in Table 1-S7.17, and its confidence equation in Table 1-S8.11. None of its paths is equal across the legal contexts.

Table 1-S8.17

Likelihood thresholds for finding probable cause and their inverted threshold sets, by condition and legal context

Condition	Threshold	Curve	Inverted threshold set
Illegal abortion			
No information	43.6	rises to one half within the rating range	expected: [24.8, 62.4]; unexpected: [23.0, 64.2]
Expected evidence	56.9	rises to one half within the rating range	[14.7, 99.2]
Unexpected evidence	36.3	rises to one half within the rating range	[0.0, 80.1]; may not exist
Improper disposal			
No information	54.6	rises to one half within the rating range	expected: [21.2, 87.7]; unexpected: [31.0, 78.0]
Expected evidence	23.0	rises to one half within the rating range	[0.0, 53.8]; may not exist
Unexpected evidence	35.9	rises to one half within the rating range	[2.5, 69.2]

Note. Threshold: the likelihood rating (offense-matched, on the rating scale) at which the condition's average predicted probability of finding probable cause first rises to one half, from the registered model with the four attitudes. Inverted threshold set: the ratings at which the joint band of the comparison contains one half on a rising curve; a set is a union of intervals, and a set that may not exist is marked. The no-information curve belongs to both comparisons of its context, so it has one set per comparison.

Table 1-S8.18

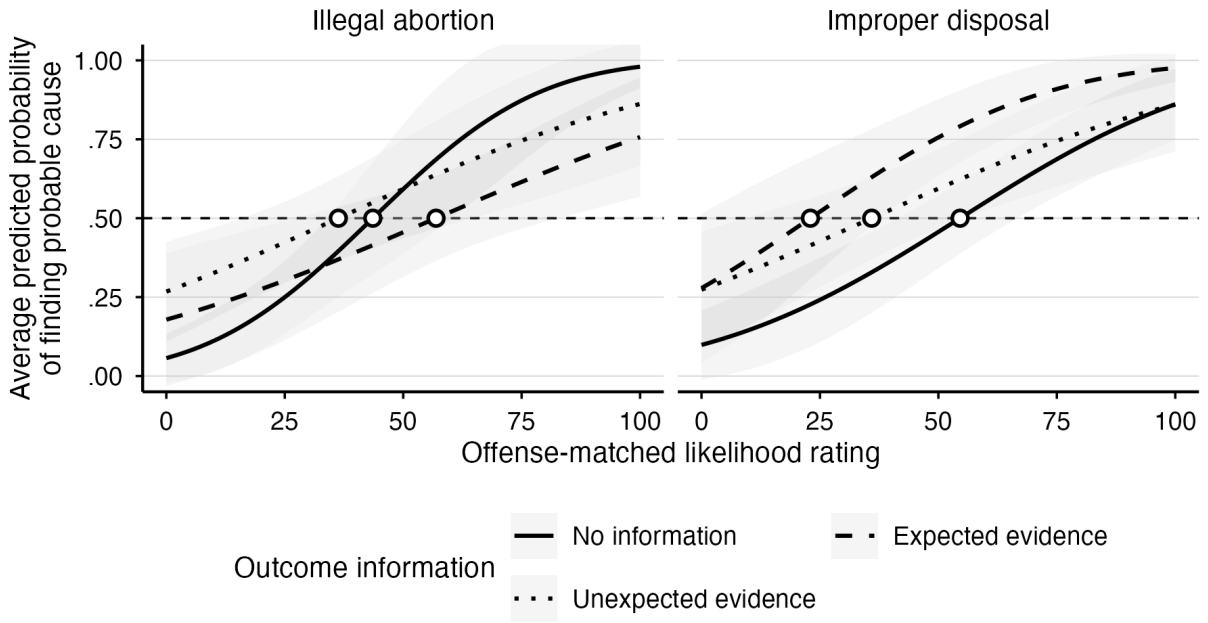

Differences between the likelihood threshold after each incriminating outcome and after no information, by legal context

Comparison	Difference	Band half-width	Difference set	May be undefined	Excludes zero
Illegal abortion					
Expected evidence minus no information	13.3	0.253	[−47.7, 74.4]	No	No
Unexpected evidence minus no information	−7.3	0.273	[−64.2, 57.1]; may not exist	Yes	not assessed
Improper disposal					
Expected evidence minus no information	−31.6	0.285	[−87.7, 32.6]; may not exist	Yes	not assessed
Unexpected evidence minus no information	−18.7	0.212	[−75.5, 38.2]	No	No

Note. Difference: the incriminating outcome's threshold minus the no-information threshold, in rating points; undefined when either curve has no threshold. Difference set: every difference of a component of the one inverted set and a component of the other, disconnected components kept. Excludes zero is assessed only for a definitive production run whose difference is defined.

Figure 1-S8.8

Average predicted probability of finding probable cause across the likelihood rating, by condition, one panel per legal context

Note. Predicted probability of finding probable cause by likelihood rating and outcome condition, from the registered threshold model with the four attitudes in the primary sample. I averaged predictions over participants within each legal context at each outcome-by-likelihood combination. The dashed .50 line identifies the threshold probability, and an open circle marks the likelihood rating where a curve crosses it. Shading gives pointwise 95% delta-method intervals from the robust covariance, cut at 0 and 1. I used the registered joint band to obtain the threshold sets in the tables; the shaded pointwise intervals do not define those sets. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Each is compared with no information. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

		With the four attitudes (registered)		Without the attitudes	
Quantity	**Letter**	**Estimate**	**Interval**	**Estimate**	**Interval**
Unexpected evidence minus no information	—	−18.7	[−75.5, 38.2]	−16.0	[−75.9, 43.8]

Note. Each row pairs the registered estimate (the model with the four attitude covariates, as printed in the table the band names, with its interval) with the same quantity from the registered companion model without the attitudes. Both are the saved cells of their models, in the units and with the interval procedure of the table named; that table's Note gives the model, the sample and the fit. — marks a quantity without a registered letter.

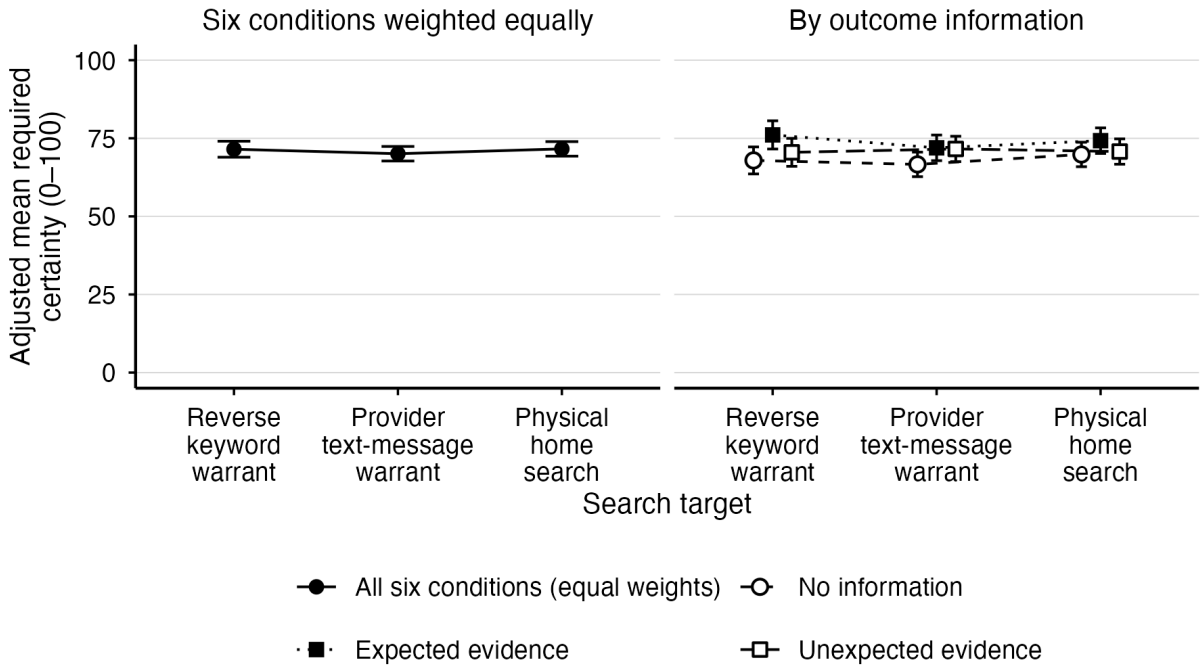

S9. RQ5: exploratory analyses

Notes shared by tables of this section.

- Tables 1-S9.1, 1-S9.2 and 1-S9.4 to 1-S9.6: No model variable was missing, so no values were imputed.
- Tables 1-S9.1 and 1-S9.4: Predicted = the registered sign; rows without a letter have no registered direction and are reported without a verdict.
- Tables 1-S9.1, 1-S9.4 and 1-S9.5: A letter is supported when its interval lies on the predicted side of zero.
- Tables 1-S9.1 and 1-S9.4: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.
- Tables 1-S9.1 and 1-S9.4: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Figure 1-S9.1

Adjusted mean certainty required for each search target, overall and by outcome information

Note. Adjusted mean certainty required for each search target from the joint model of the three certainty ratings, with attitudes at their primary-sample means. The left panel compares the targets overall, with adjacent differences corresponding to H5a and H5b. In the right panel, the two legal contexts have equal weight within each outcome condition. Error bars represent two-sided 95% *t* confidence intervals for the means, based on the model's residual degrees of freedom. The interval calculation combines the joint model covariance and the sampling covariance of the attitude means, as in the registered comparisons. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S9.1

Differences in required certainty between outcome conditions within each search target, and the adjacent-target differences compared across legal contexts and kinds of evidence

Comparison	Letter	Predicted	Difference	95% CI	Decision
Adjacent-target differences compared between legal contexts and kinds of evidence					
Provider text-message warrant – reverse keyword warrant, illegal abortion minus improper disposal	—	None	−0.40	[−4.67, 3.87]	reported without a verdict
Provider text-message warrant – reverse keyword warrant, expected minus unexpected evidence	—	None	−5.23	[−10.55, 0.09]	reported without a verdict
Physical home search – provider text-message warrant, illegal abortion minus improper disposal	—	None	−0.39	[−4.30, 3.52]	reported without a verdict
Physical home search – provider text-message warrant, expected minus unexpected evidence	—	None	3.12	[−1.75, 8.00]	reported without a verdict
Reverse keyword warrant					
Expected and unexpected evidence (equal weights) – no information	E15a	Negative	5.38	[0.01, 10.74]	not supported
Expected evidence – no information	—	None	8.17	[1.90, 14.44]	reported without a verdict
Unexpected evidence – no information	—	None	2.59	[−3.62, 8.79]	reported without a verdict
Expected evidence – unexpected evidence	—	None	5.58	[−0.80, 11.96]	reported without a verdict

Comparison	Letter	Predicted	Difference	95% CI	Decision
Provider text-message warrant					
Expected and unexpected evidence (equal weights) – no information	E15b	Negative	5.12	[0.26, 9.99]	not supported
Expected evidence – no information	—	None	5.30	[−0.38, 10.99]	reported without a verdict
Unexpected evidence – no information	—	None	4.95	[−0.68, 10.58]	reported without a verdict
Expected evidence – unexpected evidence	—	None	0.35	[−5.43, 6.14]	reported without a verdict
Physical home search					
Expected and unexpected evidence (equal weights) – no information	E15c	Negative	2.68	[−2.18, 7.53]	not supported
Expected evidence – no information	—	None	4.42	[−1.26, 10.09]	reported without a verdict
Unexpected evidence – no information	—	None	0.94	[−4.68, 6.56]	reported without a verdict

Comparison	Letter	Predicted	Difference	95% CI	Decision
Expected evidence – unexpected evidence	—	None	3.48	[−2.30, 9.25]	reported without a verdict

Note. Comparisons of adjusted means from the saved joint model of the three certainty ratings. Within each target: the four conditions with expected or unexpected evidence (weights one quarter) against the two no-information conditions (weights minus one half), and each pair of outcome conditions with the legal contexts averaged equally. First block: each adjacent-target difference in the illegal-abortion minus the improper-disposal context (outcome conditions weighted equally), and after expected minus after unexpected evidence (legal contexts weighted equally). Required certainty uses the 0–100 scale, so both means and differences are in scale points. To form the two-sided 95% t intervals on 388 degrees of freedom, I combined the model covariance with the sampling covariance of the attitude means. This includes uncertainty in the estimated attitude reference, as registered, in each comparison's standard error.

Table 1-S9.2

Associations of the four attitudes with the certainty required for each search target

	Reverse keyword warrant		Provider text-message warrant		Physical home search	
Attitude	**b**	**95% CI**	**b**	**95% CI**	**b**	**95% CI**
Abortion attitudes	−0.041	[−0.173, 0.092]	−0.032	[−0.152, 0.088]	−0.081	[−0.202, 0.039]
Support for punishment	−0.593	[−2.703, 1.518]	−0.300	[−2.213, 1.614]	−0.733	[−2.644, 1.178]
Hostile sexism	0.242	[−2.252, 2.736]	0.625	[−1.637, 2.886]	−0.923	[−3.181, 1.335]
Benevolent sexism	−0.981	[−3.518, 1.557]	−2.386	[−4.686, −0.085]	1.057	[−1.241, 3.354]

Note. Unstandardized slopes of required certainty on each attitude within each target, from the saved joint model (the four attitudes entered together, with the six condition intercepts of each target). Scale points of certainty per point of the attitude: abortion attitudes (14–98, the item sum), support for punishment (1–7), hostile and benevolent sexism (0–5). Reported without a verdict (no registered direction). Intervals: two-sided 95% t intervals on 388 degrees of freedom (each slope is a coefficient of the model; no attitude reference enters it).

Table 1-S9.3

Clustering of the certainty ratings within participants and the comparison of two covariance structures

Quantity	Value	df	p	n
Intraclass correlation (unconditional random-intercept model)	0.611			398
Between-participant variance	365.67			398
Residual (within-participant) variance	232.71			398
REML likelihood ratio: compound symmetry against the unrestricted covariance	18.49	4	< .001	398

Note. I estimated the intraclass correlation from an intercept-only model with a random participant intercept (REML). It gives the share of variance in the three ratings attributable to differences between participants. Both steps are descriptive, as registered, and change neither the registered model nor its decisions. The likelihood ratio compares, by REML with the registered fixed effects (target-specific condition intercepts and attitude slopes), a random-intercept (compound symmetry) covariance of the three ratings with the unrestricted covariance of the registered model; df = the difference in covariance parameters. n = participants with all three certainty ratings and complete attitudes. Variances are in squared scale points of the 0–100 scale.

Table 1-S9.4

Differences in the probability of approving the search between adjacent targets, and between conditions within each target

Comparison	Letter	Predicted	Difference	95% CI	Decision
Adjacent targets, six conditions weighted equally

Illegal abortion – improper disposal, outcome conditions weighted equally	—	None	−3.93	[−13.08, 5.22]	reported without a verdict
Expected evidence – no information, illegal abortion minus improper disposal	—	None	8.16	[−14.34, 30.66]	reported without a verdict

Comparison	Letter	Predicted	Difference	95% CI	Decision
Unexpected evidence – no information, illegal abortion minus improper disposal	—	None	8.41	[−13.94, 30.76]	reported without a verdict

Note. Differences between average predicted probabilities of approval from the saved logistic GEE (target by outcome by legal context, four common attitude slopes), every participant of the sample predicted in each condition with that participant's own attitudes. Adjacent targets: the six conditions weighted equally. Within each target: each pair of outcome conditions with the legal contexts averaged equally; the legal contexts compared with the outcome conditions weighted equally; and the effect of each kind of evidence compared between the legal contexts. Intervals: two-sided 95% t intervals on 376 degrees of freedom, on the participant sandwich covariance of the GEE (working independence) with the small-sample factor N/(N – p); for the average predicted probabilities, the participant influence functions add the variation of the participants' own predictions. Differences of average predicted probabilities are in percentage points.

Table 1-S9.5

Slopes of the two approval models: log odds, odds ratios and average probability slopes

		Log odds		Odds ratio		Probability slope		
Predictor	**Letter**	**b**	**95% CI**	**OR**	**95% CI**	**pp**	**95% CI**	**Decision**
Search approval (the model of E15d–E15e)								
Abortion attitudes	—	0.006	[−0.003, 0.016]	1.007	[0.997, 1.016]	0.13	[−0.06, 0.33]	reported without a verdict
Support for punishment	—	0.441	[0.280, 0.603]	1.555	[1.323, 1.828]	9.01	[6.04, 11.98]	reported without a verdict
Hostile sexism	—	0.117	[−0.053, 0.288]	1.124	[0.948, 1.333]	2.39	[−1.07, 5.85]	reported without a verdict

Predictor	Letter	Log odds		Odds ratio		Probability slope		Decision
		b	95% CI	OR	95% CI	pp	95% CI	
Benevolent sexism	—	0.024	[−0.161, 0.209]	1.024	[0.851, 1.233]	0.49	[−3.30, 4.27]	reported without a verdict
Search approval with target-matched likelihood (E15f)								
Target-matched likelihood (per ten points)	E15f	0.300	[0.229, 0.371]	1.350	[1.257, 1.449]	5.54	[4.40, 6.69]	supported
Abortion attitudes	—	0.003	[−0.008, 0.013]	1.003	[0.992, 1.013]	0.05	[−0.14, 0.24]	reported without a verdict
Support for punishment	—	0.398	[0.230, 0.566]	1.489	[1.258, 1.761]	7.35	[4.47, 10.24]	reported without a verdict
Hostile sexism	—	0.177	[−0.008, 0.362]	1.194	[0.992, 1.437]	3.27	[−0.12, 6.66]	reported without a verdict
Benevolent sexism	—	0.030	[−0.164, 0.224]	1.030	[0.849, 1.251]	0.55	[−3.03, 4.14]	reported without a verdict

Note. Log-odds slopes of the saved logistic GEEs, their odds ratios and their average local probability slopes (the derivative of each participant's predicted probability over the participant's own intended targets, averaged over participants). The likelihood slope is per ten points of the target-matched rating and is common to the three targets and six conditions; the attitude slopes are common to the targets. Only E15f has a registered direction; the attitude slopes carry no verdict. The two-sided 95% intervals use the t distribution with 376 degrees of freedom for the E15d–E15e model and 375 for the likelihood model. Both use the GEE participant sandwich covariance, working independence, and the small-sample factor N/(N − p). For probability slopes, the participant influence functions also account for variation in participants' own predictions. pp denotes percentage points per attitude point or per ten likelihood points. I exponentiated the log-odds interval to obtain the odds-ratio interval. Target-matched likelihood uses the 0–100 scale; its slope is per ten points.

Table 1-S9.6

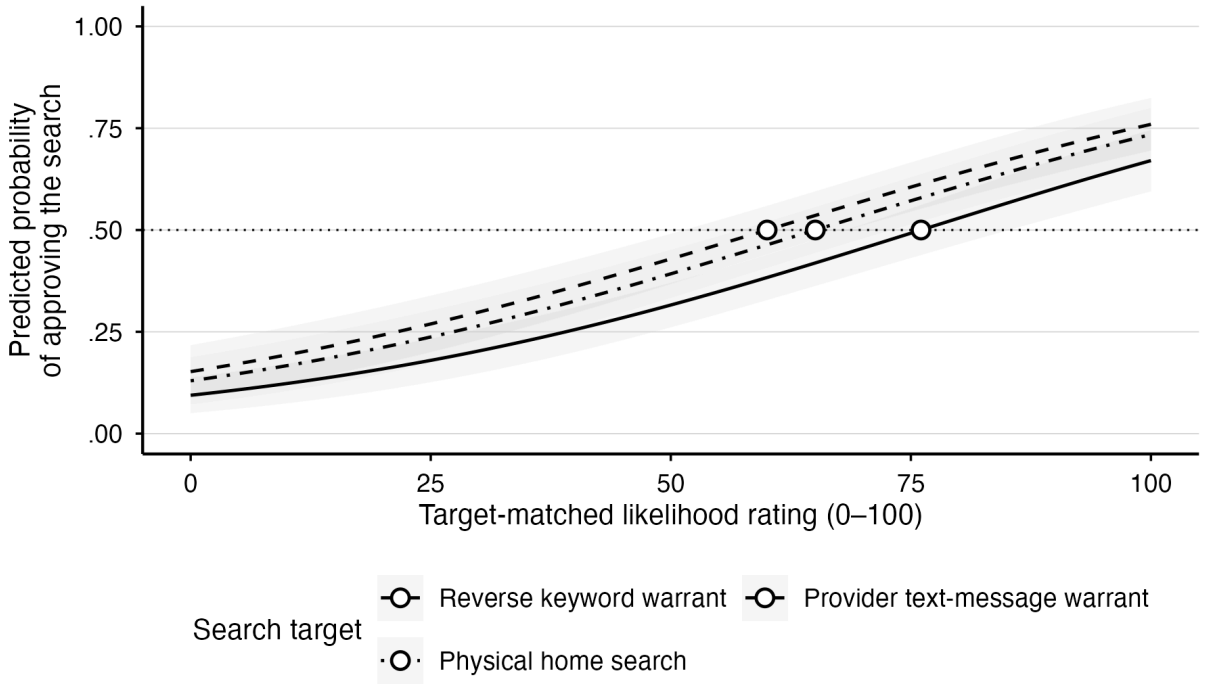

Target-matched likelihood rating at which approval of each search target becomes more likely than not (E15g)

Target	Threshold	95% CI	Curve	Resamples	Rank
Reverse keyword warrant	76.06	[68.10, 85.09]	crosses one half inside the scale	10,000 of 10,000 with a crossing	3
Provider text-message warrant	60.03	[51.08, 68.58]	crosses one half inside the scale	10,000 of 10,000 with a crossing	1
Physical home search	65.05	[56.86, 73.18]	crosses one half inside the scale	10,000 of 10,000 with a crossing	2

Note. Threshold: the likelihood rating (0–100 scale) at which the average predicted probability of approval of the target in the saved E15f model is one half, the six conditions weighted equally and the attitudes at their pooled means; none when the curve does not cross one half inside the scale. Rank orders the thresholds found, lowest first. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples, 10,000 attempted, each interval computed only from the resamples in which the curve crossed one half. E15g explored whether thresholds increased from reverse keyword warrants to physical home searches; no decision rule was registered. Resamples = attempts with a crossing out of all attempts. Intervals required an estimated threshold and at least two usable crossings.

Figure 1-S9.2

Predicted probability of approving each search target across the target-matched likelihood rating, with the approval thresholds

Note. Predicted probabilities of approving each search target from the primary-sample generalized estimating equation model (E15f). Predictions average across the six conditions, weighted equally at each value on a fixed likelihood grid, with attitudes at their pooled means. Shaded regions represent two-sided 95% *t* confidence intervals, calculated by the delta method using the participant sandwich covariance multiplied by $N/(N - p)$. An open circle marks the likelihood rating at which approval probability crosses .50 (E15g). A target has no threshold if its curve does not cross .50. The likelihood slope, the thresholds, and their intervals are in the tables.

S10. RQ6: attitudes

Notes shared by tables of this section.

- Tables 1-S10.1 and 1-S10.4: A letter is supported when its interval lies on the predicted side of zero.
- Tables 1-S10.1 to 1-S10.3: Pregnancy-evidence likelihood is in points on the 0–100 scale, foreseeability on the 1–5 scale and decision quality on the 1–7 scale; abortion attitudes are in points of their total score, centered at the mean of the participants in each model.
- Tables 1-S10.1 to 1-S10.3 and 1-S10.5: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.
- Tables 1-S10.1 to 1-S10.3 and 1-S10.5: n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis).

Table 1-S10.1

Outcome × Abortion Attitudes interactions and the difference between expected evidence and no information at three levels of abortion attitudes, legal contexts averaged

Quantity	Letter	Predicted	Estimate	SE	z	p	95% CI	Decision
Pregnancy-evidence likelihood								
Expected evidence × abortion attitudes	E16a	Positive	0.012	0.135	0.09	.926	[−0.253, 0.278]	not supported
Unexpected evidence × abortion attitudes	—	None	−0.207	0.137	−1.51	.131	[−0.476, 0.062]	reported without a verdict
Expected evidence − no information, one SD below the attitude mean	—	None	12.314	4.401	2.80	.005	[3.689, 20.940]	reported without a verdict

Quantity	Letter	Predicted	Estimate	SE	z	p	95% CI	Decision
Expected evidence – no information, at the attitude mean	—	None	12.622	2.976	4.24	< .001	[6.788, 18.456]	reported without a verdict
Expected evidence – no information, one SD above the attitude mean	—	None	12.930	4.538	2.85	.004	[4.036, 21.823]	reported without a verdict
Foreseeability								
Expected evidence × abortion attitudes	E16b	Positive	−0.003	0.005	−0.70	.487	[−0.013, 0.006]	not supported
Unexpected evidence × abortion attitudes	—	None	−0.005	0.005	−1.03	.303	[−0.014, 0.004]	reported without a verdict
Expected evidence – no information, one SD below the attitude mean	—	None	0.379	0.165	2.30	.021	[0.056, 0.702]	reported without a verdict
Expected evidence – no information, at the attitude mean	—	None	0.295	0.118	2.51	.012	[0.065, 0.526]	reported without a verdict

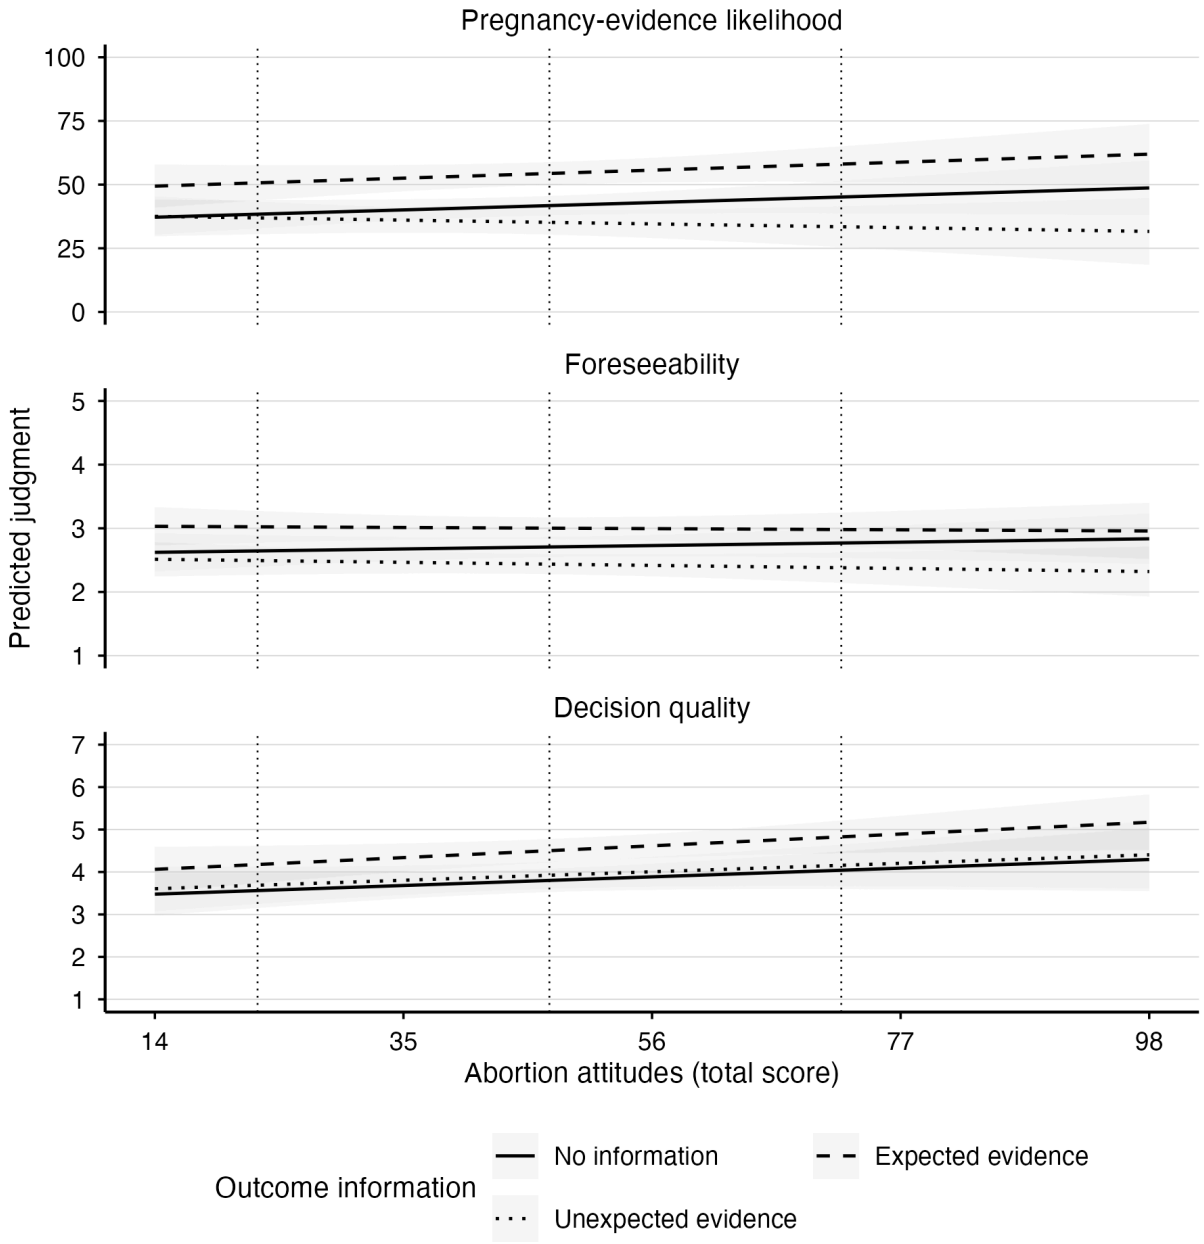

Quantity	Letter	Predicted	Estimate	SE	z	p	95% CI	Decision
Expected evidence – no information, one SD above the attitude mean	—	None	0.211	0.172	1.23	.219	[−0.125, 0.548]	reported without a verdict
Decision quality								
Expected evidence × abortion attitudes	E16c	Positive	0.003	0.009	0.41	.682	[−0.013, 0.020]	not supported
Unexpected evidence × abortion attitudes	—	None	−0.0002	0.009	−0.02	.983	[−0.018, 0.017]	reported without a verdict
Expected evidence – no information, one SD below the attitude mean	—	None	0.614	0.293	2.09	.036	[0.039, 1.189]	reported without a verdict
Expected evidence – no information, at the attitude mean	—	None	0.700	0.199	3.53	< .001	[0.311, 1.090]	reported without a verdict

Quantity	Letter	Predicted	Estimate	SE	z	p	95% CI	Decision
Expected evidence – no information, one SD above the attitude mean	—	None	0.787	0.285	2.76	.006	[0.229, 1.344]	reported without a verdict

Note. Interactions: the change in the difference between each kind of evidence and no information per point of abortion attitudes, a coefficient of the model, with its heteroskedasticity-consistent (HC3) standard error and normal Wald 95% interval. Differences at the three attitude levels: the adjusted difference between expected evidence and no information, legal contexts averaged equally, at the attitude mean of the model's participants and one standard deviation (SD) above and below it; their standard errors add the sampling covariance of that mean and SD to the HC3 covariance. z and p from the same standard error; no adjustment for multiple comparisons. The interaction slopes are shared by the two legal contexts (the registered model). Predicted = the registered sign; the unexpected-evidence interaction and the differences at the three attitude levels have no registered direction and are reported without a verdict.

Figure 1-S10.1

Predicted judgments across abortion attitudes after no information, expected evidence and unexpected evidence

Note. Predictions of the registered analyses of covariance, in which the interaction slopes are the same in both legal contexts. They were computed with marginaleffects from the fitted models and their HC3 coefficient covariance. The legal contexts are weighted equally. Sup-

port for punishment, hostile sexism, and benevolent sexism are held at the means of the participants in each model. Bands are pointwise 95% delta-method intervals of each predicted level. The registered interactions and the differences at the three attitude levels, with their intervals, are in the table above. The curves reproduce those differences exactly. Dotted lines mark the mean attitude and 1 *SD* below and above it. Pregnancy-evidence likelihood is on the 0–100 scale, foreseeability is on the 1–5 scale, and decision quality is on the 1–7 scale. Abortion attitudes are in points of the total score, centered at the mean of the participants in each model. Expected evidence is evidence consistent with a self-managed abortion. Unexpected evidence is evidence of a financial crime. Primary sample *n* per condition: illegal abortion, 68 with no information, 63 with expected evidence, and 63 with unexpected evidence; improper disposal, 71 with no information, 66 with expected evidence, and 67 with unexpected evidence. All 398 participants are in the analysis.

Table 1-S10.2

Outcome × Abortion Attitudes interactions with the slopes estimated in each legal context (registered sensitivity model)

Quantity	Estimate	SE	z	p	95% CI
Pregnancy-evidence likelihood					
Expected evidence × abortion attitudes, legal contexts averaged	0.006	0.138	0.04	.965	[−0.264, 0.276]
Unexpected evidence × abortion attitudes, legal contexts averaged	−0.210	0.140	−1.50	.134	[−0.484, 0.064]
Expected evidence − no information, one SD below the attitude mean, legal contexts averaged	12.345	4.440	2.78	.005	[3.644, 21.047]
Expected evidence − no information, at the attitude mean, legal contexts averaged	12.493	3.033	4.12	< .001	[6.548, 18.437]
Expected evidence − no information, one SD above the attitude mean, legal contexts averaged	12.640	4.668	2.71	.007	[3.491, 21.788]
Expected evidence × abortion attitudes, illegal abortion	−0.044	0.203	−0.22	.828	[−0.442, 0.354]
Unexpected evidence × abortion attitudes, illegal abortion	−0.206	0.187	−1.10	.271	[−0.572, 0.161]

Quantity	Estimate	SE	z	p	95% CI
Expected evidence × abortion attitudes, improper disposal	0.056	0.184	0.30	.761	[−0.305, 0.417]

Expected evidence × abortion attitudes, improper disposal	0.001	0.011	0.12	.906	[−0.021, 0.023]
Unexpected evidence × abortion attitudes, improper disposal	−0.003	0.012	−0.26	.796	[−0.026, 0.020]

Note. The same quantities as the table above, from the analyses of covariance with the abortion-attitude slope estimated in each of the six conditions: the context-averaged interactions and differences, then each interaction within each legal context. Interactions within a context carry their HC3 standard errors and normal Wald 95% intervals; the context-averaged rows are formed as in the registered model. Reported to show whether the E16 comparisons depend on slopes shared by the contexts; reported without a verdict.

Table 1-S10.3

Coefficients of the registered E16 analyses of covariance

Term	b	SE	z	p	95% CI
Pregnancy-evidence likelihood					
Intercept: illegal abortion, no information	28.952	4.372	6.62	< .001	[20.384, 37.521]
Intercept: improper disposal, no information	31.602	4.614	6.85	< .001	[22.558, 40.646]
Intercept: illegal abortion, expected evidence	40.197	4.861	8.27	< .001	[30.669, 49.724]
Intercept: improper disposal, expected evidence	45.602	4.695	9.71	< .001	[36.400, 54.804]

Term	b	SE	z	p	95% CI
Intercept: illegal abortion, unexpected evidence	20.610	4.983	4.14	< .001	[10.844, 30.377]
Intercept: improper disposal, unexpected evidence	26.802	4.736	5.66	< .001	[17.519, 36.085]
Abortion attitudes (slope after no information)	0.137	0.095	1.44	.151	[−0.050, 0.324]
Support for punishment	3.861	1.129	3.42	< .001	[1.648, 6.073]
Hostile sexism	−0.666	1.346	−0.49	.621	[−3.303, 1.971]
Benevolent sexism	0.144	1.289	0.11	.911	[−2.383, 2.670]
Foreseeability					
Intercept: illegal abortion, no information	2.105	0.170	12.37	< .001	[1.772, 2.439]
Intercept: improper disposal, no information	2.441	0.174	14.05	< .001	[2.101, 2.782]
Intercept: illegal abortion, expected evidence	2.491	0.198	12.60	< .001	[2.104, 2.879]
Intercept: improper disposal, expected evidence	2.646	0.168	15.71	< .001	[2.315, 2.976]
Intercept: illegal abortion, unexpected evidence	1.929	0.172	11.23	< .001	[1.593, 2.266]
Intercept: improper disposal, unexpected evidence	2.078	0.181	11.47	< .001	[1.723, 2.433]
Abortion attitudes (slope after no information)	0.003	0.004	0.67	.501	[−0.005, 0.010]
Support for punishment	0.123	0.041	3.01	.003	[0.043, 0.203]
Hostile sexism	0.001	0.049	0.02	.984	[−0.094, 0.096]
Benevolent sexism	0.019	0.047	0.39	.693	[−0.073, 0.111]
Decision quality					
Intercept: illegal abortion, no information	2.397	0.293	8.18	< .001	[1.823, 2.972]
Intercept: improper disposal, no information	2.507	0.285	8.79	< .001	[1.948, 3.065]
Intercept: illegal abortion, expected evidence	2.842	0.321	8.86	< .001	[2.213, 3.470]

Term	b	SE	z	p	95% CI
Intercept: improper disposal, expected evidence	3.463	0.314	11.04	< .001	[2.848, 4.078]
Intercept: illegal abortion, unexpected evidence	2.708	0.331	8.18	< .001	[2.059, 3.357]
Intercept: improper disposal, unexpected evidence	2.438	0.307	7.95	< .001	[1.837, 3.039]
Abortion attitudes (slope after no information)	0.010	0.007	1.44	.150	[−0.004, 0.023]
Support for punishment	0.407	0.071	5.75	< .001	[0.268, 0.546]
Hostile sexism	0.104	0.083	1.25	.212	[−0.059, 0.266]
Benevolent sexism	−0.044	0.081	−0.54	.589	[−0.203, 0.115]

Note. Unstandardized coefficients of each saved model with HC3 standard errors, z tests and normal Wald 95% intervals. Each intercept is the model's prediction in its condition with abortion attitudes at the mean of the model's participants and the other three attitudes at zero; the abortion-attitude slope is the slope after no information, and each interaction is the difference between that slope after the evidence and after no information. R^2 of each model is in the models table. Reported without a verdict. The interaction terms are in Table 1-S10.1.

Table 1-S10.4

Indirect and total associations of hostile and benevolent sexism with suspect punishment, and the routing differences

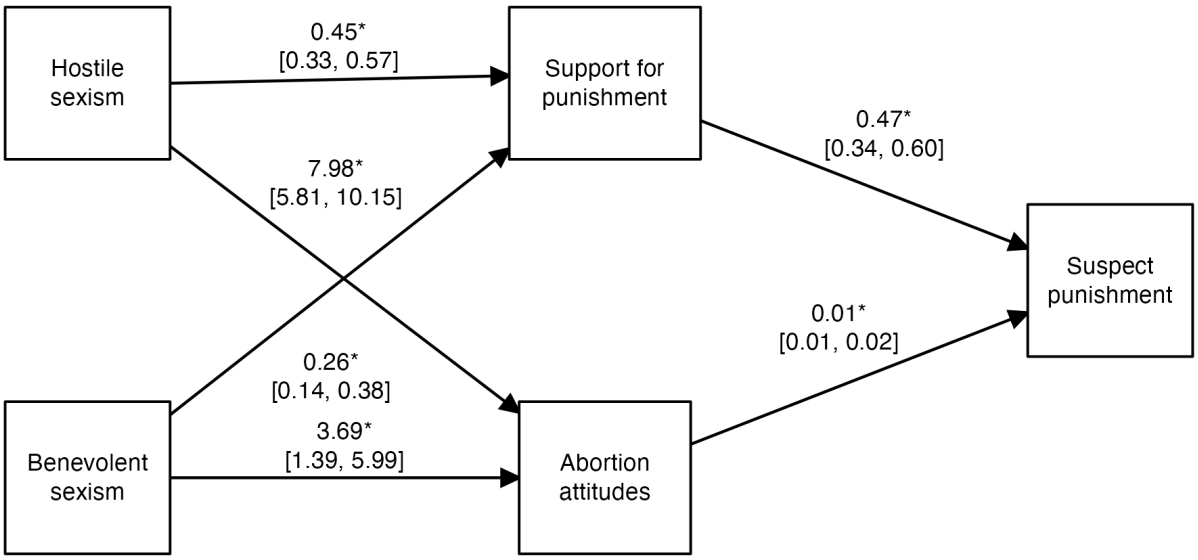

Quantity	Letter	Predicted	Estimate	95% CI	Decision
Hostile sexism					
Indirect, through support for punishment	—	None	0.212	[0.134, 0.299]	reported without a verdict
Indirect, through abortion attitudes	—	None	0.119	[0.049, 0.197]	reported without a verdict
Total (sum of the two indirect associations)	E17a	Positive	0.332	[0.242, 0.427]	supported

Quantity	Letter	Predicted	Estimate	95% CI	Decision
Routing: through support for punishment minus through abortion attitudes	E17c	Positive	0.093	[−0.032, 0.222]	not supported
Benevolent sexism					
Indirect, through support for punishment	—	None	0.120	[0.061, 0.190]	reported without a verdict
Indirect, through abortion attitudes	—	None	0.055	[0.015, 0.111]	reported without a verdict
Total (sum of the two indirect associations)	E17b	Positive	0.175	[0.098, 0.264]	supported
Routing: through abortion attitudes minus through support for punishment	E17d	Positive	−0.065	[−0.148, 0.012]	not supported

Note. Indirect associations are products of the unstandardized sexism-to-mediator and mediator-to-punishment paths; totals sum the two indirect associations of a sexism score; routing differences subtract them as registered. Intervals: two-sided 95% percentile bootstrap intervals (type 6) from participant resamples stratified within the six conditions, 10,000 attempted and 10,000 usable. Predicted = the registered sign: the totals are expected to be positive, hostile sexism to run more through support for punishment and benevolent sexism more through abortion attitudes. The four specific indirect associations are reported without a verdict. Suspect punishment is rated on the 1–7 scale; the indirect and total associations are in suspect-punishment points per point of the sexism score. Family line of E17a, E17b, E17c, E17d together (the supplement's E17 sentence, "All of these conditions will need to be met for E17a–E17d to be supported"): the E17 routing pattern is not supported. It is reported beside the per-letter decisions and is not one of the registered decision rules.

Figure 1-S10.2

Fitted sexism, attitude and suspect-punishment chains (E17a–E17d)

Note. The figure shows the fitted single-group path model in the primary sample. E17a–E17d run from hostile and benevolent sexism through support for punishment and abortion attitudes to suspect punishment. E17a and E17b are the total indirect effects of each sexism score (i.e., the sum of its two routes). E17c and E17d are the differences between the two routes of each score. Each path shows its unstandardized estimate and robust (Huber–White) Wald 95% interval in the original units. Solid paths have intervals that exclude zero, and dashed paths have intervals that include zero. The figure omits the outcome-information and legal-context covariates of suspect punishment, the covariance of the two sexism scores, and the covariance of the mediator disturbances. The path table reports them. The indirect effects are products of the paths and appear in the indirect-effect table.

Table 1-S10.5

Unstandardized and standardized path estimates of the E17 model

Predictor	b (SE)	95% CI	p	β
Predicting support for punishment				
Hostile sexism	0.454 (0.061)	[0.335, 0.573]	< .001	0.400
Benevolent sexism	0.257 (0.062)	[0.135, 0.379]	< .001	0.205
Predicting abortion attitudes				
Hostile sexism	7.982 (1.108)	[5.810, 10.155]	< .001	0.436
Benevolent sexism	3.690 (1.173)	[1.390, 5.990]	.002	0.182
Predicting suspect punishment				
Support for punishment	0.467 (0.066)	[0.338, 0.597]	< .001	0.366
Abortion attitudes	0.015 (0.004)	[0.007, 0.023]	< .001	0.189
Expected evidence	1.085 (0.194)	[0.705, 1.465]	< .001	0.260
Unexpected evidence	0.374 (0.207)	[−0.032, 0.780]	.071	0.090
Improper disposal (legal context)	0.351 (0.164)	[0.029, 0.673]	.033	0.090
Covariances				
Support for punishment with abortion attitudes	9.235 (1.486)	[6.323, 12.147]	< .001	0.348
Hostile sexism with benevolent sexism	0.831 (0.087)	[0.660, 1.001]	< .001	0.509

Note. b = unstandardized estimate; β = fully standardized estimate. I tested b, not β. The tests used robust (Huber–White) standard errors, and both the p values and the normal Wald 95% confidence intervals are two-sided. The disturbances of the two mediators, support for punishment and abortion attitudes, could covary with each other, but I fixed their covariances with the suspect-punishment disturbance at zero. Expected evidence and unexpected evidence are each coded against no information; improper disposal against illegal abortion.

Table 1-S10.6

Global fit and variance explained of the E17 model

Quantity	Value
χ^2 (robust, scaled)	8.17, df = 8, p = .417
CFI (robust)	1.000
RMSEA (robust) [90% CI]	.008 [.000, .060]
SRMR	.019
R^2, support for punishment	.285
R^2, abortion attitudes	.304
R^2, suspect punishment	.307

Note. Global fit indices are the robust indices of the fitted models; R^2 of each endogenous variable from the fitted model. R^2 does not depend on the fitting scale. Reported without a verdict (the registration sets no fit criterion for E17). RMSEA and its 90% interval: lavaan's robust RMSEA and its robust interval as lavaan reports them (fitMeasures() rmsea.robust, rmsea.ci.lower.robust and rmsea.ci.upper.robust, at lavaan's default 90% level).

S11. Secondary estimates with the legal contexts pooled

Table 1-S11.1

Secondary estimates with the legal contexts pooled, in the sensitivity sample, reported without a verdict

		Sensitivity sample		
Letter and target	**Analysis**	**Estimate**	**95% CI**	**Interval**
RQ1: hindsight pathways and likelihood judgments				
H1a (legal contexts pooled): Expected evidence → evidence relevance → pregnancy-evidence likelihood	Hindsight pathways	−1.121	[−2.427, −0.206]	percentile bootstrap (type 6)
H1b (legal contexts pooled): Unexpected evidence → evidence relevance → pregnancy-evidence likelihood	Hindsight pathways	−1.018	[−2.443, −0.060]	percentile bootstrap (type 6)
H1c (legal contexts pooled): Expected evidence → consequence severity → foreseeability	Hindsight pathways	0.002	[−0.026, 0.025]	percentile bootstrap (type 6)
H1d (legal contexts pooled): Unexpected evidence → consequence severity → foreseeability	Hindsight pathways	−0.001	[−0.021, 0.016]	percentile bootstrap (type 6)
H1e (legal contexts pooled): Financial-crime evidence likelihood: unexpected evidence − no information	Financial-crime evidence likelihood comparisons	26.884	[19.423, 34.344]	Student t, df = 331
H1f (legal contexts pooled): Nothing-incriminating likelihood: expected evidence − no information	Nothing-incriminating likelihood comparisons	−14.012	[−21.859, −6.165]	Student t, df = 331

		Sensitivity sample		
Letter and target	**Analysis**	**Estimate**	**95% CI**	**Interval**
H1g (legal contexts pooled): Nothing-incriminating likelihood: unexpected evidence – no information	Nothing-incriminating likelihood comparisons	−15.139	[−22.985, −7.292]	Student t, df = 331
H1h (legal contexts pooled): Pregnancy-evidence likelihood: expected evidence – no information	Pregnancy-evidence likelihood comparisons	13.376	[6.953, 19.800]	Student t, df = 331
H1i (legal contexts pooled): Pregnancy-evidence likelihood: unexpected evidence – no information	Pregnancy-evidence likelihood comparisons	−8.375	[−14.799, −1.952]	Student t, df = 331
RQ2: the detective and the warrant decision				
H2a (legal contexts pooled): Pregnancy-evidence likelihood → decision quality	Likelihood and foreseeability associations	0.024	[0.017, 0.031]	robust normal Wald
H2b (legal contexts pooled): Foreseeability → decision quality	Likelihood and foreseeability associations	0.468	[0.294, 0.641]	robust normal Wald
RQ4: probable-cause rulings				
H4b (legal contexts pooled): Expected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	Relevance pathways to scalar probable cause–confidence	−1.072	[−2.598, −0.159]	percentile bootstrap (type 6)
H4c (legal contexts pooled): Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	Relevance pathways to scalar probable cause–confidence	−0.974	[−2.530, −0.060]	percentile bootstrap (type 6)

		Sensitivity sample		
Letter and target	**Analysis**	**Estimate**	**95% CI**	**Interval**
H4d (legal contexts pooled): Expected minus unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	Relevance pathways to scalar probable cause–confidence	−0.098	[−1.213, 0.862]	percentile bootstrap (type 6)

Note. For each letter that the registered legal-context rule moves (H1a–H1i, H2a–H2b, and H4b–H4d), the table gives the target that letter's rule would read under the pooled set. For a structural model, the estimate comes from its registered version with the legal contexts pooled. For an analysis of covariance, I averaged the registered model's comparison over the two legal contexts with equal weights, keeping the Outcome × Legal Context interaction in the model. The legal-context rule kept the grouped set as primary, so these pooled estimates are secondary. They carry no verdict. Intervals are the 95% intervals each analysis saved (percentile bootstrap for an indirect effect, normal Wald for a coefficient, Student t for an analysis of covariance). Percentile-bootstrap resamples behind the bootstrap intervals of this table, over the attempt records of its analyses: sensitivity sample, 10,000 attempted and 10,000 usable. Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence. n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis). The primary-sample estimates are the pooled rows with the four attitudes in Tables 1-S4.5, 1-S4.10, 1-S4.13 and 1-S4.25.

S12. The sensitivity sample

Notes shared by tables of this section.

- Tables 1-S12.1 and 1-S12.2: Expected evidence = evidence consistent with a self-managed abortion; unexpected evidence = financial-crime evidence.

Table 1-S12.1

Participants in each condition of the primary and sensitivity samples

	n		
Condition	**Primary sample**	**Sensitivity sample**	**Not retained**
Illegal abortion, no information	68	55	13
Illegal abortion, expected evidence	63	56	7
Illegal abortion, unexpected evidence	63	54	9
Improper disposal, no information	71	56	15
Improper disposal, expected evidence	66	62	4
Improper disposal, unexpected evidence	67	58	9
All conditions	398	341	57

Note. Counts from the analysis sample; the sensitivity sample is the primary sample minus the participants the registered sensitivity exclusions remove. Not retained: 57 failed or skipped the outcome manipulation check and 0 completed the study in less than one-third of the median completion time (0 both).

Every percentile-bootstrap analysis in this two-sample comparison met the registered minimum of 9,500 usable resamples in both samples: 10,000 resamples were attempted for each analysis in each sample, and the fewest usable were 9,662 (relevance pathways to probable cause, sensitivity sample).

Table 1-S12.2

Letters whose registered decision differs between the primary and the sensitivity samples

	Primary sample			Sensitivity sample		
Letter and target	**Estimate**	**95% CI**	**Decision**	**Estimate**	**95% CI**	**Decision**
RQ1: hindsight pathways and likelihood judgments						
H1i (illegal abortion): Pregnancy-evidence likelihood: unexpected evidence – no information	−7.814	[−16.287, 0.658]	not supported	−11.808	[−20.984, −2.632]	supported
E2c (improper disposal): Disposal-evidence likelihood: expected evidence – no information	9.991	[−0.160, 20.142]	not supported	12.894	[1.979, 23.809]	supported
RQ2: the detective and the warrant decision						
E6a (improper disposal): Expected evidence → decision quality (direct)	0.414	[−0.010, 0.839]	not supported	0.509	[0.060, 0.957]	supported
E6b (illegal abortion): Unexpected evidence → decision quality (direct)	0.465	[0.010, 0.919]	supported	0.353	[−0.165, 0.871]	not supported

	Primary sample			Sensitivity sample		
Letter and target	**Estimate**	**95% CI**	**Decision**	**Estimate**	**95% CI**	**Decision**
RQ3: moral judgments of the suspect						
H3d (illegal abortion): Unexpected evidence → pregnancy-evidence likelihood → blame	−0.266	[−0.585, 0.027]	not supported	−0.371	[−0.712, −0.075]	supported
E9b (illegal abortion): Unexpected evidence → pregnancy-evidence likelihood → blame	−0.153	[−0.360, 0.011]	not supported	−0.233	[−0.483, −0.046]	supported
E9c (illegal abortion): Expected evidence → negligence → blame	0.468	[0.035, 0.995]	supported	0.438	[−0.072, 1.078]	not supported
RQ4: probable-cause rulings						
H4c (illegal abortion): Unexpected evidence → evidence relevance → pregnancy-evidence likelihood → scalar probable cause–confidence	−1.160	[−3.190, −0.027]	supported	−1.078	[−3.282, 0.001]	not supported

	Primary sample			Sensitivity sample		
Letter and target	**Estimate**	**95% CI**	**Decision**	**Estimate**	**95% CI**	**Decision**
E10c (legal contexts averaged): Expected evidence – no information	5.064	[0.288, 9.606]	supported	4.090	[−1.031, 9.052]	not supported
E13d (illegal abortion): Unexpected evidence → pregnancy-evidence likelihood → probable-cause ruling	−0.138	[−0.354, 0.013]	not supported	−0.202	[−0.469, −0.040]	supported
E13e (improper disposal): Unexpected evidence → foreseeability → probable-cause ruling	−0.194	[−0.445, −0.028]	supported	−0.176	[−0.451, 0.0001]	not supported
E13f (illegal abortion): Unexpected evidence → sum of the two indirect effects	−0.210	[−0.501, 0.036]	not supported	−0.337	[−0.685, −0.098]	supported
E13h (improper disposal): Unexpected evidence → probable-cause ruling	0.533	[−0.006, 1.148]	not supported	0.591	[0.012, 1.282]	supported

	Primary sample			Sensitivity sample		
Letter and target	**Estimate**	**95% CI**	**Decision**	**Estimate**	**95% CI**	**Decision**
E13o (illegal abortion): Expected evidence → confidence in the ruling	6.910	[0.167, 13.653]	supported	7.080	[−0.295, 14.456]	not supported

Note. I evaluated each registered letter's required target in the primary legal-context set. Directional support required the entire interval on the predicted side of zero. I did not test differences between samples. H3d: substitute mediator: pregnancy-evidence likelihood; deviation 2 in S1. Each row's interval uses its letter's registered procedure. n per condition, primary sample: Illegal abortion: No information 68, Expected evidence 63, Unexpected evidence 63; Improper disposal: No information 71, Expected evidence 66, Unexpected evidence 67 (all 398 in the analysis). n per condition, sensitivity sample: Illegal abortion: No information 55, Expected evidence 56, Unexpected evidence 54; Improper disposal: No information 56, Expected evidence 62, Unexpected evidence 58 (all 341 in the analysis). Decisions differed on 14 of the 264 letter-and-target rows; only those rows are shown.

About this document

This part includes the supplementary tables and figures for Study 2. For the main findings, see Chapter 5. The supplementary materials cover data cleaning and missing data, descriptive and preliminary analyses, manipulation checks, RQ1 through RQ5, and the sensitivity sample. Within S1 through S9, I grouped each analysis with its hypotheses and comparisons. The tables and figures reproduce the final Study 2 estimates.

Table and figure numbers identify the study and the section. For example, Table 2-S4.1 begins S4. The H4a–H4h comparisons and adjusted H4 means are in S6.

Study 2 Design and Materials

In Study 2, I adapted the civil-juror case materials of Casper et al. (1989) and Robbennolt & Sobus (1997) to a pregnancy-loss arrest. Participants acted as jurors in a fictional § 1983 false-arrest suit and read one randomly assigned case file. Table S2D.1 links the design to the study materials, and Figure S2D.1 shows the six conditions.

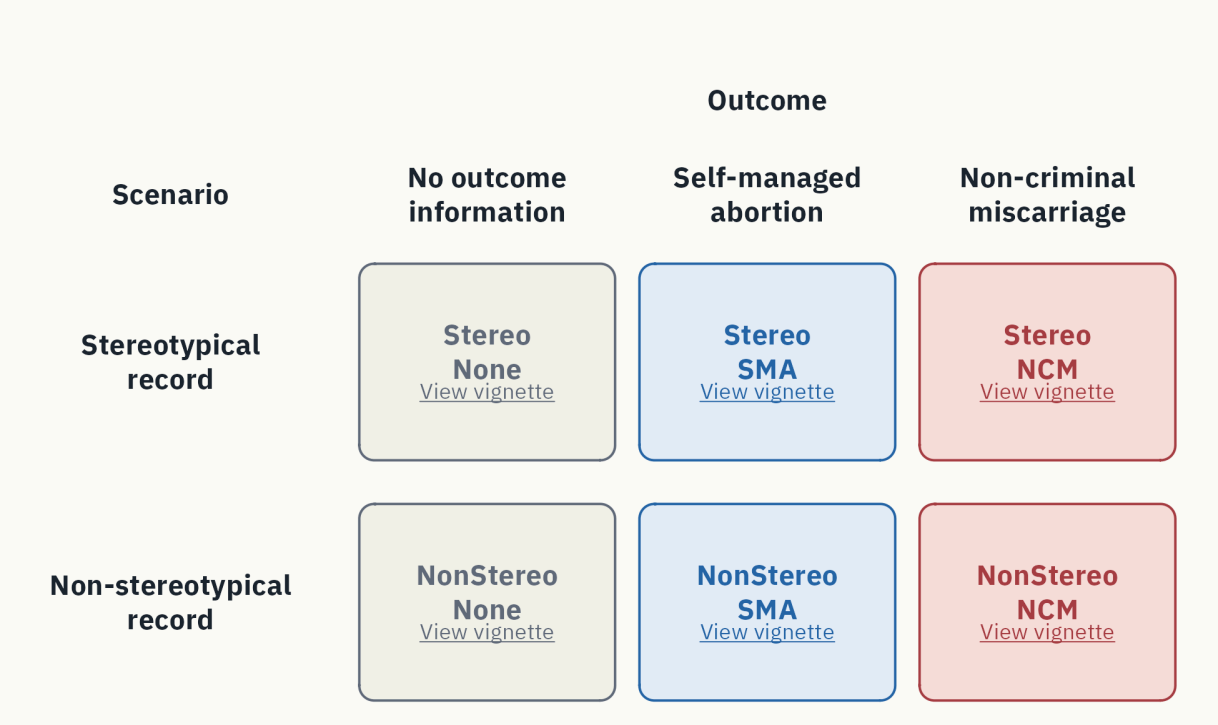

Table S2D.1

Study 2 Design and Materials

Component	What participants received	Materials
Design	2 pre-arrest records × 3 later outcome-information levels, between participants; one of six case files.	Figure S2D.1 and the six condition links below
Pre-arrest record	A stereotypical self-managed-abortion record or a non-stereotypical record following the non-criminal miscarriage prototype.	Record variations
Later outcome information	Agreed facts reporting self-managed abortion (SMA), non-criminal miscarriage (NCM), or no determination of the cause (None). The judge instructed participants to assess probable cause using what the detective knew at the arrest.	Agreed-facts variations and document-image previews
Procedure	After consent and instructions, the assigned case file; probable-cause judgments; remaining case judgments and damages; surprise; checks, attitudes, and demographics; debriefing.	Full survey wording

Figure S2D.1

The Six Experimental Conditions in Study 2

Note. Stereo = stereotypical pre-arrest record; NonStereo = non-stereotypical pre-arrest record; None = no outcome information; SMA = self-managed abortion; NCM = non-criminal miscarriage. The six condition links below open the corresponding participant-view materials.

Condition Materials

- Stereotypical record, no outcome information
- Stereotypical record, self-managed abortion
- Stereotypical record, non-criminal miscarriage
- Non-stereotypical record, no outcome information
- Non-stereotypical record, self-managed abortion
- Non-stereotypical record, non-criminal miscarriage

The Materials and Measures chapter reproduces the stimulus variations, survey questions, and response scales. The materials hub provides document-image previews. The preregistration and registered materials PDF provide the planned design and wording; the deviations record documents departures.

Study 2 Materials and Measures

The stimulus variations and study-specific survey questions are reproduced below. The stimulus materials and registered Study 2 materials and measures are also available.

Stimulus Wording

Table S2D.2

Study 2 passages that differed between the stereotypical and non-stereotypical conditions

Document	Stereotypical condition	Non-stereotypical condition
Transcript, the tip	"that she'd taken care of it herself, at home, with some pills she'd ordered online"	"that she'd handled it herself, at home"
Transcript and report, address	214 Oak Tree Lane, apartment 3B	1817 Maple Lane, apartment 2A
Transcript, household	"she lived with a roommate, and… the roommate had been out of town on the 13th. And she said she wasn't married, and she didn't have any kids."	"she lived with her husband, Daniel, and their two kids, and they're both school age. And he'd been at work on the 13th, and the kids were at school. And she said she'd told her husband what happened… that same day, once he got home."
Transcript, activity after the incident	"on the afternoon of the 13th she went and kept a hair appointment, and… it was something she already had on the books. And then she worked her shifts at the store on the 14th and the 15th."	"she went and picked the kids up from school, like usual, that afternoon on the 13th. And then she worked her shifts at the store on the 14th and the 15th, and… she still did the school drop-off and pickup those days."
Report, date of birth and age	11-29-05, 18 years	03-15-93, 31 years
Report, dependents	No	Yes (2)

Table S2D.3

Study 2 summary of agreed facts, section 3, NCM and foresight conditions

Condition	Section 3, "What Was Discovered After the Arrest"
NCM	"After the arrest, investigators obtained medical records that Ms. Johnston had not previously provided to the police. The records established that Ms. Johnston had received prenatal care at an obstetrics-and-gynecology clinic, and that the pregnancy loss had been a spontaneous miscarriage of a clinically wanted pregnancy, with no evidence of any self-induced cause."
Foresight (no outcome information)	"The pre-arrest investigation summarized in Plaintiff's Exhibit 1 was the only investigation conducted regarding the cause of the pregnancy loss. No additional forensic, medical, or investigative records bearing on the cause of the pregnancy loss have been generated since the arrest, and the cause of the pregnancy loss has not been formally determined."

A. Attention Checks

1. To show you are reading each question carefully, please choose 'Neither Agree nor Disagree.'
2. We want to make sure your responses are thoughtful. Please choose 'Strongly Agree' for this item.
3. Please read all instructions carefully. For this question, select 'Disagree' as your answer.

(Response options for each: Strongly disagree / Disagree / Neither agree nor disagree / Agree / Strongly agree)

B. Probable-Cause Judgments

1. *Subjective-probability slider.* "Based on the evidence available at the time of the arrest, what is the probability that Ms. Johnston committed reckless feticide?" (slider 0-100%; 0% = definitely did not commit the offense to 100% = definitely committed the offense)
2. *Binary probable-cause ruling.* "Based on the evidence that was available at the time of her arrest, do you believe Detective Snyder had probable cause to arrest Ms. Johnston for reckless feticide?" (**Binary**; *No* / *Yes*)
3. *Confidence in ruling.* "How confident are you in this decision?" (0–100 slider; 0 = not at all confident to 100 = completely confident)

C. Outcome Likelihood Estimates (Evelo & Greene, 2013)

Instructions: "Based only on what was known at the time of the decision to arrest Ms. Johnston, please indicate the probability, from 0% to 100%, that each of the following statements is true. There are many possible accounts of what happened in this case; please rate each statement independently."

Probability (0–100%)

0 10 20 30 40 50 60 70 80 90 100

1. *Intentional termination (target item).* "Ms. Johnston intentionally caused her pregnancy to end through medication."
2. *Reckless self-conduct (inculpatory alternative account).* "Ms. Johnston's pregnancy ended as an unintended result of her own conduct (for example, using a substance or not seeking medical care), without her intending to end it."
3. *Natural cause (exculpatory alternative account).* "Ms. Johnston's pregnancy ended from a natural cause, with nothing she or anyone else did contributing to it."
4. *External or third-party cause (exculpatory alternative account).* "Ms. Johnston's pregnancy ended because of an accident, an injury, or another person's actions."

D. Plaintiff Mens Rea (Model Penal Code Culpability Hierarchy)

Section introduction: "Next, you will answer some questions about your perception of the plaintiff in the case you read about."

Strongly disagree — Strongly agree · 1 2 3 4 5 6 7 · Four items, rated separately (no composite).

Instructions: "Please indicate your agreement or disagreement with each of the following statements about Ms. Johnston's state of mind. (1 = strongly disagree; 7 = strongly agree)"

Strongly disagree Strongly agree

1 2 3 4 5 6 7

1. It was Ms. Johnston (the plaintiff)'s purposeful objective to end the pregnancy. *(purposely)*

2. Ms. Johnston (the plaintiff) was practically certain that the pregnancy would end. *(knowingly)*
3. Ms. Johnston (the plaintiff) was aware of a substantial risk that the pregnancy would end. *(recklessly)*
4. Ms. Johnston (the plaintiff) should have been aware of a substantial risk that the pregnancy would end. *(negligently)*

E. Perceived Foreseeability of the Post-Arrest Investigation Result (Roese & Vohs, 2012)

Strongly disagree — Strongly agree · 1 2 3 4 5 · Item 2 reverse-scored; four items averaged into the composite, plus a single general-foreseeability item.

> *Instructions (SMA-outcome and NCM-outcome cells):* "Based only on what was known at the time of the decision to arrest Ms. Johnston, please indicate how strongly you agree or disagree with each statement as a description of the situation you read about."

> *Instructions (None-outcome cells):* "Based only on what was known at the time of the decision to arrest Ms. Johnston, please indicate how strongly you agree or disagree with each statement as a description of the situation you read about. (For these items, please think about what investigators would have likely concluded if the post-arrest investigation had continued past the arrest.)"

Strongly disagree Strongly agree

1 2 3 4 5

1. Detective Snyder would have known all along what the post-arrest investigation would conclude at the time he made the arrest.
2. It was difficult for Detective Snyder to predict what the post-arrest investigation would conclude when he decided to make the arrest. *(reverse-scored)*
3. Detective Snyder had a clear and vivid idea of what the post-arrest investigation would conclude at the time he made the arrest.

4. Overall, from Detective Snyder's perspective, the outcome of the post-arrest investigation was foreseeable.

5. Based only on what was known at the time of the decision to arrest Ms. Johnston, overall, from Detective Snyder's perspective, it was foreseeable that the post-arrest investigation could uncover evidence that Ms. Johnston had committed some criminal offense. *(general-foreseeability item; not part of the composite)*

F. Evidence Interpretation

Participants rate each of the ten facts on two dimensions: relevance and incrimination. Both use a 9-point scale. Relevance ratings precede incrimination ratings, and item order is randomized within each dimension. Participants complete these ratings once, after receiving the assigned outcome information.

> **Items shown to Ps in the Stereotypical variant (SMA-prototype):**
>
> 1. That an anonymous coworker reported Ms. Johnston had said she used pills ordered online to handle it at home.
> 2. That Ms. Johnston experienced cramping and heavy bleeding at home.
> 3. That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.
> 4. That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.
> 5. That Ms. Johnston did not call 911 or seek in-person medical care.
> 6. That Ms. Johnston was 18 years old, unmarried, and had no children.
> 7. That Ms. Johnston lived with a roommate, who was out of town on the day of the event.
> 8. That Ms. Johnston did not tell anyone on the day of the event.
> 9. That Ms. Johnston kept a hair appointment that afternoon and worked her shifts over the next two days.
> 10. That Detective Snyder had 14 years of experience with the Millfield Police Department.

> **Items shown to Ps in the Non-stereotypical variant (NCM-prototype):**
>
> 1. That an anonymous coworker reported Ms. Johnston had said she handled it at home by herself.
> 2. That Ms. Johnston experienced cramping and heavy bleeding at home.
> 3. That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.
> 4. That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.
> 5. That Ms. Johnston did not call 911 or seek in-person medical care.
> 6. That Ms. Johnston was 31 years old, married, and had two school-age children.
> 7. That Ms. Johnston lived with her husband and two children, who were at work and at school on the day of the event.
> 8. That Ms. Johnston told her husband on the day of the event.
> 9. That Ms. Johnston completed school pickup that afternoon and worked her shifts over the next two days while managing school drop-off and pickup.
> 10. That Detective Snyder had 14 years of experience with the Millfield Police Department.

Relevance Ratings

Instructions: "In trying to predict what the post-arrest investigation would conclude, how relevant would it be to know each of the following pieces of information? Please rate how relevant you think each piece of information is."

Not at all relevant Extremely relevant

1 2 3 4 5 6 7 8 9

Incriminating Ratings

Instructions: "For each of the following pieces of information from the case, please rate how incriminating it is (that is, how much it points toward the idea that she is guilty of something). (1 = not at all incriminating; 9 = extremely incriminating)"

Not at all incriminating Extremely incriminating

1 2 3 4 5 6 7 8 9

G. Sympathy for the Plaintiff

Section introduction: "Next, you will answer some questions about your perception of the plaintiff in the case you read about."

None at all — A great deal · 1 2 3 4 5 6 7 · Single item.

1. *Sympathy.* "How much sympathy do you feel for Ms. Johnston (the plaintiff) in this case?" (1 = *none at all*; 7 = *a great deal*)

H. Plaintiff's Moral Culpability (Ms. Johnston as Target) (Alicke, 2000; Cushman, 2008; Malle et al., 2014)

Three single-item 7-point measures, rated separately (no composite); anchors as shown per item.

> "
>
> 1 7
>
> "

1. *Plaintiff blame.* "To what extent is Ms. Johnston (the plaintiff) blameworthy for what happened?" (1 = *not at all blameworthy*; 7 = *extremely blameworthy*)

2. *Plaintiff responsibility.* "How responsible is Ms. Johnston (the plaintiff) for what happened?" (1 = *not at all responsible*; 7 = *completely responsible*)

3. *Plaintiff punishment.* "How much punishment does Ms. Johnston (the plaintiff) deserve for what happened?" (1 = *no punishment at all*; 7 = *very severe punishment*)

Multi-Model Blame Items (Alicke et al., 2008; Cushman, 2008; Malle et al., 2014)

Five single-item 7-point measures, rated separately; anchors as shown per item.

4. *Agent causality.* "To what extent did Ms. Johnston (the plaintiff)'s actions cause the pregnancy loss?" (1 = *not at all a cause*; 7 = *very strong cause*)

5. *Reasons / justification.* "Did Ms. Johnston (the plaintiff) have justified reasons for her conduct during the pregnancy?" (1 = *not at all justified*; 7 = *completely justified*)

6. *Preventability.* "Could Ms. Johnston (the plaintiff) have prevented the pregnancy loss?" (1 = *definitely not*; 7 = *definitely yes*)
7. *Spontaneous character.* "Given what you know about Ms. Johnston (the plaintiff) from these case materials, do you have a generally favorable or unfavorable impression of her?" (1 = *very unfavorable*; 7 = *very favorable*; reverse-valence: higher = more favorable)
8. *Wrongness.* "Was Ms. Johnston (the plaintiff)'s conduct during the pregnancy morally wrong?" (1 = *not at all*, 4 = *somewhat*, 7 = *very much*)

I. Officer's Moral Culpability

Section introduction: "Next, you will answer some questions about your perception of the detective in the case you read about."

1. *Officer blameworthiness.* "To what extent is Detective Snyder blameworthy for his decision to arrest Ms. Johnston?" (0 = *not at all blameworthy*; 10 = *extremely blameworthy*)
2. *Consequence severity.* "How severe a consequence should Detective Snyder face for his decision to make the arrest?" (0 = *no consequence at all*; 10 = *very severe consequence*)
3. *Right or wrong.* "How right or wrong was Detective Snyder's decision to make the arrest?" (0 = *not wrong at all*; 10 = *very wrong*)

J. Quality of the Officer's Decision

Instructions: "Think back to the time when Detective Snyder decided to arrest Ms. Johnston and rate the quality of his decision."

Strongly disagree Strongly agree

1 2 3 4 5 6 7

1. The process leading to Detective Snyder's decision to arrest Ms. Johnston was clear and transparent.
2. Detective Snyder's decision was fair and unbiased.
3. Any reasonable detective in this position would have made the same decision.
4. The decision was made responsibly, taking all relevant information into account.

5. Overall, it was a good decision to arrest Ms. Johnston.

K. Damages (Robbennolt & Sobus, 1997)

Preamble. As the juror in this case, you are now asked to decide what amount of money damages, if any, Ms. Johnston (the plaintiff) should receive from Detective Snyder. There are two kinds of damages, and you will be asked about each separately. If you believe Ms. Johnston should receive no damages, you may enter $0. In closing argument, Ms. Johnston's counsel asked the jury to award $75,000 in compensatory damages and $500,000 in punitive damages. You are not required to award these amounts; the amount you award, if any, is entirely for you to decide. **Compensatory damages.** If you decide Ms. Johnston (the plaintiff) should recover, compensatory damages are the amount of money that will fairly compensate her for the harm you find she sustained as a direct result of the arrest. This may include out-of-pocket losses, loss of liberty, emotional distress, personal humiliation, and damage to her reputation. You must not award compensatory damages as a way of punishing Detective Snyder or out of sympathy. How much, if anything, do you award Ms. Johnston in compensatory damages? Response: numeric text entry (whole dollars). No default. **Punitive damages.** Punitive damages are separate from compensatory damages and are not meant to compensate Ms. Johnston (the plaintiff) further. If you find that Detective Snyder's conduct was malicious or showed reckless indifference to Ms. Johnston's rights, you may — but are not required to — award punitive damages, to punish him and to discourage him and other officers from similar conduct in the future. Any amount you award should bear a reasonable relationship to the harm caused. How much, if anything, do you award Ms. Johnston in punitive damages? Response: numeric text entry (whole dollars). No default.

Severity of consequences.

"How serious are the consequences of what happened in this case?" (1 = *not at all serious*; 7 = *extremely serious*)

L. Manipulation Checks

Stereotypicality Manipulation Check

"According to the case file you read, the fact pattern Detective Snyder was investigating most closely matched:"

Response options:

- An 18-year-old unmarried woman with no children, who lived with a roommate who was out of town on the day of the event, who did not tell anyone that day, and whose coworker reported she had said she used pills ordered online to handle it at home. *(correct for Stereotypical)*
- A 31-year-old married woman with two school-age children, who lived with her husband and children, who told her husband on the day of the event, and whose coworker reported she had said she handled it at home by herself. *(correct for Non-stereotypical)*
- A criminal disposal of remains following an unrelated event.
- None of the above; the fact pattern did not point clearly to any of these.
- I'm not sure.

Outcome Manipulation Check

"Did the case file include a summary of what was discovered after the arrest about the cause of the pregnancy loss, and if so, what did it say?"

Response options:

- Yes: the summary said a post-arrest joint investigation by the Carter County coroner's and prosecutor's offices, including review of records subpoenaed from an online telehealth service, determined that the pregnancy loss had been induced by mifepristone and misoprostol pills Ms. Johnston had obtained through that service. *(correct for SMA-outcome)*
- Yes: the summary said a post-arrest joint investigation by the Carter County coroner's and prosecutor's offices, including review of medical records from Ms. Johnston's obstetric provider, determined that the pregnancy loss had been a spontaneous miscarriage of a clinically wanted pregnancy with no evidence of any self-induced cause. *(correct for NCM-outcome)*
- Yes: the summary said no additional forensic, medical, or investigative records bearing on the cause of the loss have been generated since the arrest, and the cause has not been formally determined. *(correct for None-outcome)*
- I don't remember.

Content-Recognition Check

"Which of the following facts was NOT in the case scenario you read about?"

Response options:

- (a) The Millfield Police Department received an anonymous tip about Ms. Johnston.
- (b) Detective Snyder conducted a knock-and-talk interview with Ms. Johnston at her residence.
- (c) Ms. Johnston's mother contacted the police about her behavior. *(correct answer — this fact was NOT in the case)*
- (d) Detective Snyder interviewed Ms. Johnston's coworker Andi Donen at the retail store.

Resultant-Surprise Check (Exploratory)

1. *Resultant surprise.* "How surprising was the post-arrest agreed-facts summary, given the arrest report and Detective Snyder's testimony?" (1 = *not at all surprising*; 7 = *extremely surprising*)

2. *Expectation fit (reverse-scored).* "How well did the agreed-facts summary fit what you would have expected based on the arrest report and testimony?" (1 = *did not fit at all*; 7 = *fit extremely well*)

M–S. Individual-Difference Measures and Demographics

The six individual-difference scales and the demographic items were administered with the same items in Pilot 2, Study 1, and Study 2 and are provided in the registered Study 2 materials and measures: the Modified Abortion Attitude Scale, Support for Punishment of Women for Miscarriage, the Ambivalent Sexism Inventory short form, the religiosity scale, the political-orientation items, the Outcome Preference Measure, and the demographic items, including the federal-jury-eligibility item that only Study 2 administered.

S1. Data cleaning, eligibility and missing data

Missing data

Table 2-S1.1

Participant-item pairs by stage and condition

Stage	Administered	Answered	Unanswered	Not administered
Overall				
Admitted, before exclusions	41724	41723	1	3660
Primary sample	36480	36479	1	3200
Stereotypical, None				
Admitted, before exclusions	6954	6953	1	610
Primary sample	6270	6269	1	550
Stereotypical, SMA				
Admitted, before exclusions	7068	7068	0	620
Primary sample	5928	5928	0	520
Stereotypical, NCM				
Admitted, before exclusions	7524	7524	0	660
Primary sample	6840	6840	0	600
Non-stereotypical, None				
Admitted, before exclusions	6726	6726	0	590
Primary sample	5928	5928	0	520
Non-stereotypical, SMA				
Admitted, before exclusions	6612	6612	0	580
Primary sample	5700	5700	0	500
Non-stereotypical, NCM				
Admitted, before exclusions	6840	6840	0	600

Stage	Administered	Answered	Unanswered	Not administered
Primary sample	5814	5814	0	510

Note. Administered = answered + unanswered; not administered counts items a participant never saw. Before exclusions, *N* = 366 (Stereotypical, None, *n* = 61; Stereotypical, SMA, *n* = 62; Stereotypical, NCM, *n* = 66; Non-stereotypical, None, *n* = 59; Non-stereotypical, SMA, *n* = 58; Non-stereotypical, NCM, *n* = 60). *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

In the primary sample, every administered item was answered except for 1 response to probability of guilt (Stereotypical, None). Not administered (items a participant never saw): 1600 participant-item pairs of evidence relevance (15 items) and 1600 participant-item pairs of evidence incrimination (15 items); every other measure was administered in full.

S2. Descriptive and preliminary analyses

Notes shared by tables of this section.

- Tables 2-S2.1 to 2-S2.6, 2-S2.8 and 2-S2.15 to 2-S2.17: M (SD) by outcome by stereotypicality condition; N = participants with a response, all conditions.
- Tables 2-S2.1 to 2-S2.5, 2-S2.8 and 2-S2.15 to 2-S2.17: Every participant answered every variable.
- Tables 2-S2.1 to 2-S2.9 and 2-S2.15 to 2-S2.17: *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Sample, judgment and attitude descriptions (D01)

Table 2-S2.1

Abortion and miscarriage likelihood judgments by condition

	Stereotypical			Non-stereotypical				
Variable: M (SD)	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**	**Total**	**N**
Abortion outcome likelihood	44.76 (32.60)	60.79 (31.92)	40.12 (27.74)	35.15 (29.63)	47.26 (37.51)	25.39 (25.04)	42.24 (32.49)	320
Miscarriage outcome likelihood	39.47 (32.23)	27.88 (25.76)	45.38 (30.07)	58.54 (29.10)	31.28 (31.21)	60.57 (29.12)	43.88 (31.89)	320

Note. Available responses only; condition-level missing counts range from 0 to 1 across these variables.

Table 2-S2.7

Evaluations of the detective and the arrest relative to the scale midpoint, primary sample, all conditions pooled

Evaluation	n	Mdn	Scale	Midpoint	Relative to the midpoint					Participants (%)		
					M – midpoint	95% CI	t	df	p	Below	At	Above
Decision quality	320	3.40	1–7	4.0	−0.34	[−0.54, −0.13]	−3.24	319	.001	55.3	3.4	41.2
Detective blame	320	6.00	0–10	5.0	0.50	[0.11, 0.90]	2.51	319	.012	36.9	10.0	53.1
Deserved consequences for the detective	320	4.00	0–10	5.0	−0.94	[−1.29, −0.59]	−5.29	319	< .001	52.5	12.8	34.7
Wrongness of the arrest	320	6.00	0–10	5.0	0.42	[0.04, 0.79]	2.20	319	.029	35.0	13.4	51.6

Note. Descriptive only: this table is not a registered analysis and carries no decision rule. Primary sample, the six conditions pooled; n = participants with a response. Scale = the item ends (decision quality is the mean of its items); midpoint = (minimum + maximum) / 2. M – midpoint with its one-sample Student t 95% interval (df = n – 1), t and two-sided p. Participants (%) = the share of responses below, at and above the midpoint. M and SD are in the Total column of Table 2-S2.5.

Religiosity	51	4	.90	[.84, .95]

Note. Raw-score Cronbach's α; religiosity is standardized-item α with item SDs recalculated across all complete respondents and applied to every condition (Table below). n = complete respondents. Intervals are percentile 95% intervals from 10000 within-condition participant bootstrap attempts that preserve each condition's number of complete respondents. Usable bootstrap attempts: 10000 of 10000 for every row. No row was unavailable.

Table 2-S2.13

Religiosity items: pooled means and SDs used for the standardized-item alpha

Item	M	SD	n
Religiosity: attendance	2.39	1.64	320
Religiosity: importance	4.47	3.23	320
Religiosity: comfort	2.57	1.40	320
Religiosity: religious person	4.13	3.09	320

Note. Item means and SDs across all complete respondents in the analytic sample; the same SDs standardize the items in every condition.

Checks (D03)

The response status of each check for all conditions together is in the All conditions rows of Table 2-S3.4 (the attention checks and content recognition) and in the all-conditions Admitted rows of Table 2-S3.2 and Table 2-S3.3 (the stereotypicality and outcome checks).

Fixed relevance and incrimination measurement (M01)

Table 2-S2.14

The ten evidence facts behind each item position, by evidence version

Evidence	Marker	Fact
Position 1		
Stereotypical		That an anonymous coworker reported Ms. Johnston had said she used pills ordered online to handle it at home.
Non-stereotypical		That an anonymous coworker reported Ms. Johnston had said she handled it at home by herself.
Position 2		
Both versions	marker	That Ms. Johnston experienced cramping and heavy bleeding at home.
Position 3		
Both versions		That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.

Evidence	Marker	Fact
Position 4		
Both versions		That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.
Position 5		
Both versions		That Ms. Johnston did not call 911 or seek in-person medical care.
Position 6		
Stereotypical		That Ms. Johnston was 18 years old, unmarried, and had no children.
Non-stereotypical		That Ms. Johnston was 31 years old, married, and had two school-age children.
Position 7		
Stereotypical		That Ms. Johnston lived with a roommate, who was out of town on the day of the event.
Non-stereotypical		That Ms. Johnston lived with her husband and two children, who were at work and at school on the day of the event.
Position 8		
Stereotypical		That Ms. Johnston did not tell anyone on the day of the event.
Non-stereotypical		That Ms. Johnston told her husband on the day of the event.
Position 9		
Stereotypical		That Ms. Johnston kept a hair appointment that afternoon and worked her shifts over the next two days.
Non-stereotypical		That Ms. Johnston completed school pickup that afternoon and worked her shifts over the next two days while managing school drop-off and pickup.
Position 10		
Both versions		That Detective Snyder had 14 years of experience with the Millfield Police Department.

Note. Fact wording from the evidence-indicator map the analysis uses. One row band per item position. A fact both versions share is printed once.

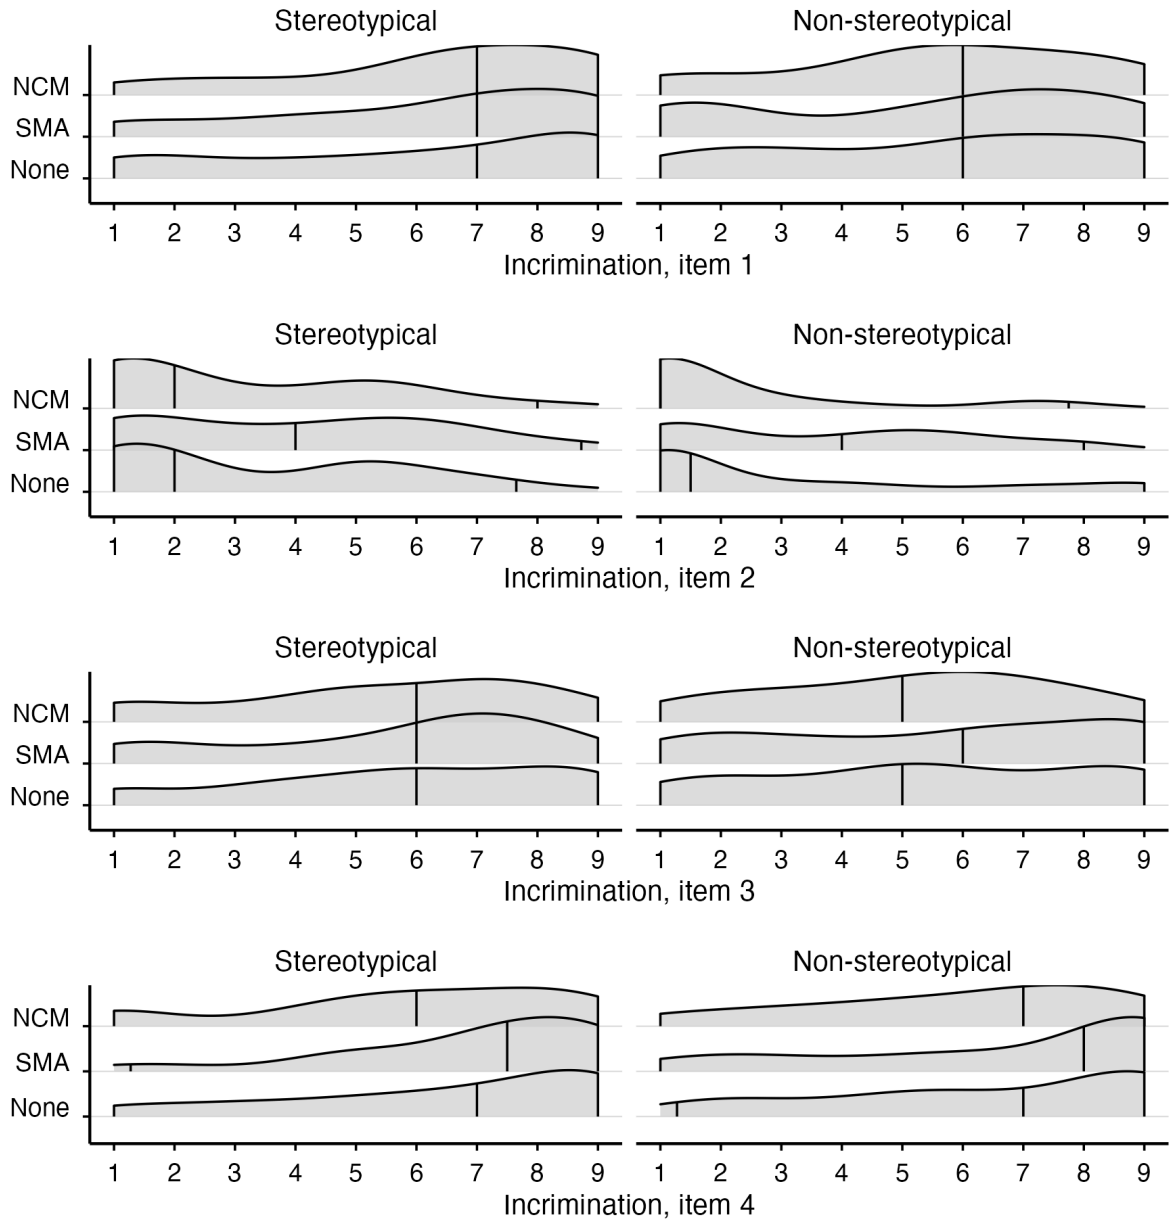

Figure 2-S2.5 (continued)

Surprise premise check

Table 2-S2.18

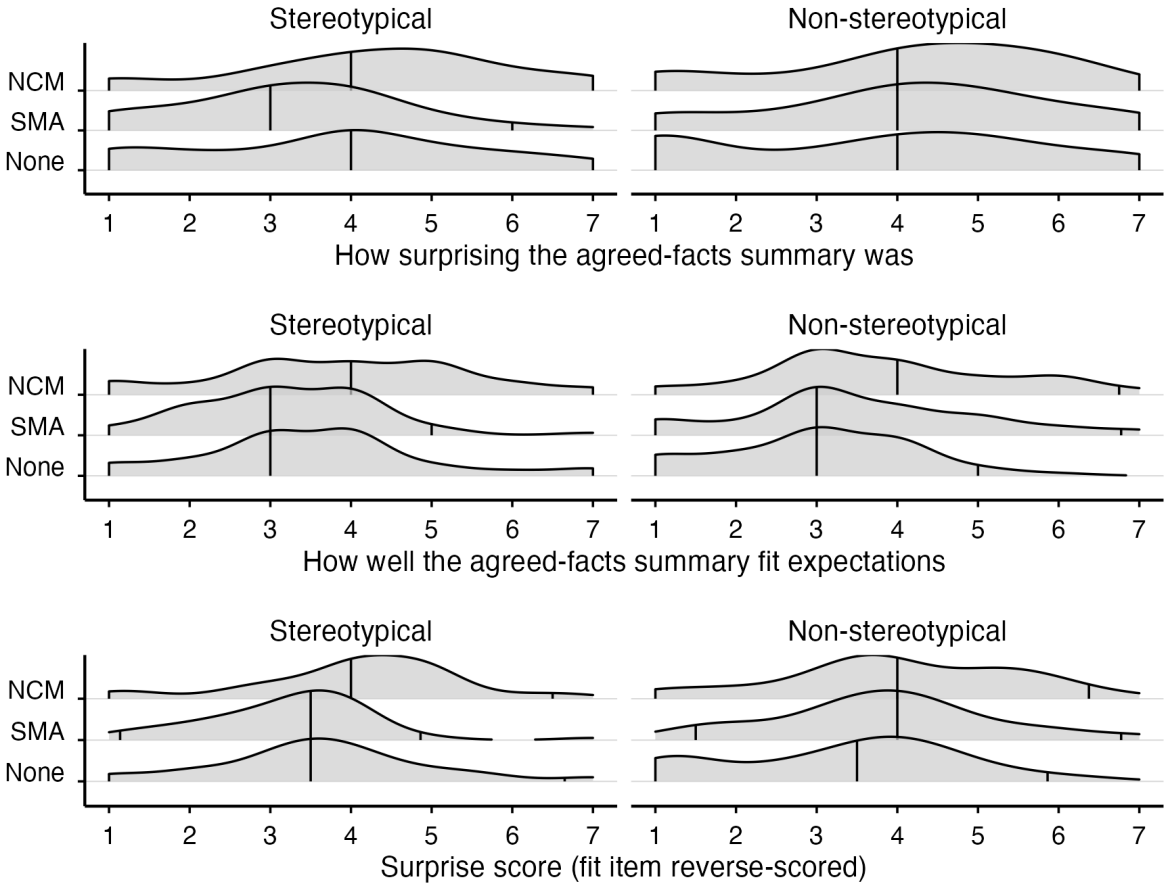

Surprise premise check: contradicting minus confirming outcome information, two-by-two ANCOVA

Version	Estimate	SE	df	95% CI	N	Includes zero
primary sample						
adjusted	0.33	0.18	205	[−0.02, 0.68]	213	yes
unadjusted	0.33	0.18	209	[−0.02, 0.68]	213	yes
sensitivity sample						
adjusted	0.56	0.23	136	[0.11, 1.01]	144	no
unadjusted	0.57	0.22	140	[0.12, 1.01]	144	no

Note. Contrast: Contradicting minus confirming outcome information: mean(A_NCM, M_SMA) - mean(A_SMA, M_NCM), outcome-information participants (surprise premise check; reported). Student t 95% interval with the residual df of each fit; the adjusted versions control for the four attitude measures, the unadjusted versions do not. N = the analysis's eligible participants (outcome-information conditions only). A premise check, not a registered hypothesis: nothing is decided here.

Figure 2-S2.6

Surprise ratings by outcome condition and stereotypicality condition

S3. Manipulation checks and the registered stereotypicality rule

Notes shared by tables of this section.

- Tables 2-S3.1 to 2-S3.3: 95% CI = Wilson score interval for the proportion, without continuity correction.
- Tables 2-S3.2 and 2-S3.3: *n* per condition from the eligibility records of the data preparation.
- Tables 2-S3.2 and 2-S3.3: Primary = the primary analytic sample; Admitted = all admitted participants.

The registered stereotypicality rule

Table 2-S3.1

Stereotypicality check in the primary sample: the registered rule, by evidence condition

Evidence condition	n	Matching description	I'm not sure	Blank	Rate (%)	95% CI	At or above threshold
Stereotypical	167	156	7	0	93.4	[88.6, 96.3]	yes
Non-stereotypical	153	147	3	0	96.1	[91.7, 98.2]	yes

Note. Primary sample. *n* per evidence condition from the eligibility records of the data preparation. Rate = matching descriptions / *n* "I'm not sure" and a blank response do not match. Registered threshold: 60%, read from the quoted supplement sentence. Verdict: manipulated.

Identification rates for both manipulations

Table 2-S3.2

Stereotypicality check: participants choosing the description that matches their evidence

Sample	n	Identifying	I'm not sure	Other choice	Blank	Rate (%)	95% CI
Stereotypical							
Primary	167	156	7	4	0	93.4	[88.6, 96.3]
Admitted	189	174	8	7	0	92.1	[87.3, 95.1]

Sample	n	Identifying	I'm not sure	Other choice	Blank	Rate (%)	95% CI
Non-stereotypical							
Primary	153	147	3	3	0	96.1	[91.7, 98.2]
Admitted	177	169	3	5	0	95.5	[91.3, 97.7]
Stereotypical, None							
Primary	55	51	2	2	0	92.7	[82.7, 97.1]
Admitted	61	55	3	3	0	90.2	[80.2, 95.4]
Stereotypical, SMA							
Primary	52	48	3	1	0	92.3	[81.8, 97.0]

Admitted	66	44	12	10	0	66.7	[54.7, 76.8]

Sample	n	Identifying	I don't remember	Other choice	Blank	Rate (%)	95% CI
Non-stereotypical, None							
Primary	52	28	14	10	0	53.8	[40.5, 66.7]
Admitted	59	31	16	12	0	52.5	[40.0, 64.7]
Non-stereotypical, SMA							
Primary	50	30	5	15	0	60.0	[46.2, 72.4]
Admitted	58	37	5	16	0	63.8	[50.9, 74.9]
Non-stereotypical, NCM							
Primary	51	32	8	11	0	62.7	[49.0, 74.7]
Admitted	60	40	8	12	0	66.7	[54.1, 77.3]
All conditions							
Primary	320	186	69	65	0	58.1	[52.7, 63.4]
Admitted	366	215	76	75	0	58.7	[53.6, 63.7]

Note. Rate = identifying responses / *n*.

Attention and content recognition

Table 2-S3.4

Response status on the attention and content-recognition checks, by check and condition

Check	n	Correct	Incorrect	Missing	Rule it feeds
All conditions					
Attention check 1	366	365	1	0	primary
Attention check 2	366	365	1	0	primary
Attention check 3	366	365	1	0	primary
Content recognition	366	310	56	0	sensitivity only

Check	n	Correct	Incorrect	Missing	Rule it feeds
Stereotypical, None					
Attention check 1	61	60	1	0	primary
Attention check 2	61	60	1	0	primary
Attention check 3	61	60	1	0	primary
Content recognition	61	47	14	0	sensitivity only
Stereotypical, SMA					
Attention check 1	62	62	0	0	primary
Attention check 2	62	62	0	0	primary
Attention check 3	62	62	0	0	primary
Content recognition	62	49	13	0	sensitivity only
Stereotypical, NCM					
Attention check 1	66	66	0	0	primary
Attention check 2	66	66	0	0	primary
Attention check 3	66	66	0	0	primary
Content recognition	66	58	8	0	sensitivity only
Non-stereotypical, None					
Attention check 1	59	59	0	0	primary
Attention check 2	59	59	0	0	primary
Attention check 3	59	59	0	0	primary
Content recognition	59	52	7	0	sensitivity only
Non-stereotypical, SMA					
Attention check 1	58	58	0	0	primary
Attention check 2	58	58	0	0	primary
Attention check 3	58	58	0	0	primary
Content recognition	58	50	8	0	sensitivity only
Non-stereotypical, NCM					
Attention check 1	60	60	0	0	primary
Attention check 2	60	60	0	0	primary
Attention check 3	60	60	0	0	primary

Check	n	Correct	Incorrect	Missing	Rule it feeds
Content recognition	60	54	6	0	sensitivity only

Note. All admitted participants; *n* per condition from the eligibility records of the data preparation. Rule it feeds: primary where the rule reads “exclude only if all three observed responses are incorrect”; sensitivity only where it reads “sensitivity only”. The stereotypicality and outcome checks are in the Admitted rows of Table 2-S3.2 and Table 2-S3.3.

S4. Likelihood judgments and evidence reinterpretation (RQ1)

Notes shared by tables of this section.

- Tables 2-S4.1, 2-S4.3, 2-S4.4 and 2-S4.6 to 2-S4.12: *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).
- Tables 2-S4.4 and 2-S4.8: Percentile bootstrap intervals use 10000 participant resamples drawn within conditions, with 9995 usable per product. I did not replace failed attempts.
- Tables 2-S4.4 and 2-S4.9: Estimator ML with robust.huber.white standard errors and missing = ml.
- Tables 2-S4.4, 2-S4.5 and 2-S4.9: No model variable was missing, so no auxiliary items were used.
- Tables 2-S4.9 and 2-S4.12: Exploratory: reported without a support gate.

Likelihood judgments (H1a–H1g)

Table 2-S4.1

Equivalence tests for H1b and H1g: two one-sided tests with the registered 90% interval

Comparison	Estimate	90% CI	Bounds	p (lower)	p (upper)	Decision
H1b: Abortion likelihood, Stereotypical evidence, SMA – None	16.05	[6.36, 25.74]	[−5.00, 5.00]	< .001	.970	not supported by all registered criteria
H1g: Miscarriage likelihood, Non-stereotypical evidence, NCM – None	4.99	[−4.12, 14.09]	[−5.00, 5.00]	.036	.499	not supported by all registered criteria

Note. TOST = two one-sided tests of equivalence within −5 to 5 points on the 0–100 likelihood scale. Lower and upper p values test the nulls of differences ≤ −5 and ≥ 5, respectively. The larger p value is the TOST p value. CI = Student t 90% confidence interval.

Table 2-S4.2

Analysis of Covariance for the Two Likelihood Judgments (Primary Sample, Adjusted)

Source	F	df1	df2	p	partial_eta2	90% CI
Abortion likelihood						
evidence	14.45	1	310	< .001	.045	[.020, 1.000]
outcome	14.07	2	310	< .001	.083	[.046, 1.000]
Abortion attitudes	0.61	1	310	.434	.002	[.000, 1.000]
Punishment support	8.77	1	310	.003	.028	[.009, 1.000]
Hostile sexism	0.06	1	310	.813	.000	[.000, 1.000]
Benevolent sexism	0.12	1	310	.727	.000	[.000, 1.000]
evidence:outcome	0.32	2	310	.728	.002	[.000, 1.000]
Miscarriage likelihood						
evidence	18.70	1	310	< .001	.057	[.029, 1.000]
outcome	21.84	2	310	< .001	.124	[.080, 1.000]
Abortion attitudes	0.87	1	310	.352	.003	[.000, 1.000]
Punishment support	9.28	1	310	.003	.029	[.010, 1.000]
Hostile sexism	3.87	1	310	.050	.012	[.001, 1.000]
Benevolent sexism	0.52	1	310	.471	.002	[.000, 1.000]
evidence:outcome	2.14	2	310	.119	.014	[.000, 1.000]

Note. Evidence × outcome = the registered restricted-versus-full F test (2 numerator df). The Type-II F-tests have partial eta-squared (η^2_p) with noncentral F 90% CIs; sums of squares and mean squares are omitted. I used emmeans to calculate adjusted means at the covariate mean(s). The ANCOVA covariates were abortion attitudes, support for punishment, hostile sexism, and benevolent sexism.

Table 2-S4.3

Baseline expectations: stereotypical minus non-stereotypical evidence in the None condition

Version	Expected	Estimate	SE	t	df	p	95% CI
Abortion likelihood, primary sample							
adjusted	above zero	9.36	5.85	1.60	310	.111	[−2.15, 20.87]
unadjusted	above zero	9.61	5.98	1.61	314	.109	[−2.15, 21.37]
Abortion likelihood, sensitivity sample							
adjusted	above zero	15.69	7.44	2.11	202	.036	[1.02, 30.37]
unadjusted	above zero	14.70	7.51	1.96	206	.052	[−0.11, 29.52]
Miscarriage likelihood, primary sample							
adjusted	below zero	−18.53	5.41	−3.43	310	< .001	[−29.17, −7.88]
unadjusted	below zero	−19.07	5.74	−3.32	314	.001	[−30.36, −7.77]
Miscarriage likelihood, sensitivity sample							
adjusted	below zero	−26.21	6.74	−3.89	202	< .001	[−39.50, −12.92]
unadjusted	below zero	−25.03	7.08	−3.53	206	< .001	[−38.99, −11.07]

Note. Estimate = stereotypical minus non-stereotypical evidence in the no-information condition; Expected = registered direction. Student t 95% confidence intervals used the full coefficient covariance and residual df. Descriptive comparison; no support decision.

Evidence reinterpretation (H2a–H2d)

Table 2-S4.4

Indirect effects of outcome information on the two likelihood judgments through evidence relevance (H2a–H2d)

Letter	Evidence	Contrast	Likelihood	Direction	Indirect effect b	95% percentile CI	Usable attempts	Decision
H2a	Non-stereotypical	SMA – None	Abortion likelihood	above zero	−1.51	[−4.98, 2.35]	9995 of 10000	not supported by all registered criteria
H2b	Non-stereotypical	SMA – None	Miscarriage likelihood	below zero	1.88	[−3.11, 6.01]	9995 of 10000	not supported by all registered criteria
H2c	Stereotypical	NCM – None	Abortion likelihood	below zero	0.93	[−1.97, 4.15]	9995 of 10000	not supported by all registered criteria
H2d	Stereotypical	NCM – None	Miscarriage likelihood	above zero	−1.16	[−5.22, 2.43]	9995 of 10000	not supported by all registered criteria

Note. Indirect effect = the outcome difference in latent relevance (the SMA or NCM factor intercept; the no-information intercept is fixed at 0) times the relevance-to-likelihood slope, which is common to the six conditions, on the 0–100 likelihood scale; primary sample, adjusted. Direction = the registered sign; a letter's rule reads its interval against zero in that direction. Registered analysis path: latent. The fit of the whole model is in Table 2-S4.5. Decision: each letter's registered rule applied to its saved interval.

Figure 2-S4.1

Fitted chains of the registered latent relevance model (H2a–H2d)

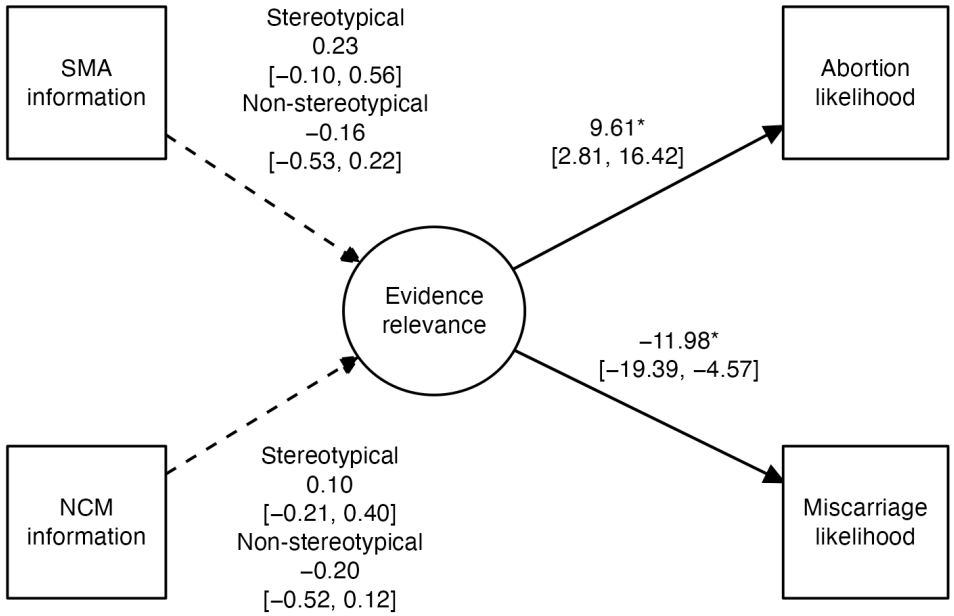

Table 2-S4.5

Fit of the Registered Latent Relevance Model Across Samples and Adjustment Versions

Version	N	chi2	df	p	chi2/ df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
primary sample										
adjusted	320	1294.41	668	< .001	1.94	0.657	0.630	0.133	[0.122, 0.143]	0.144
unadjusted	320	892.15	404	< .001	2.21	0.612	0.619	0.151	[0.137, 0.164]	0.154
sensitivity sample										
adjusted	212	1258.95	668	< .001	1.88	0.584	0.552	0.158	[0.144, 0.172]	0.164
unadjusted	212	842.21	404	< .001	2.08	0.551	0.560	0.175	[0.158, 0.192]	0.178

Note. CFI, TLI, and RMSEA used scaled χ^2; RMSEA 90% confidence intervals were derived from the noncentral χ^2 distribution. N is the number of eligible participants in the analysis. The registration specifies no fit cutoffs for this model.

Table 2-S4.6

Relevance, item 6	All non-stereotypical	Relevance	0.74	0.49	[−0.23, 1.70]	1.50	.134				0.21	0.27	0.24
Relevance, item 7	All stereotypical	Relevance	1.68	0.56	[0.58, 2.77]	3.01	.003	0.59	0.57	0.62			
Relevance, item 7	All non-stereotypical	Relevance	1.54	0.48	[0.61, 2.48]	3.23	.001				0.44	0.53	0.58

								β: Stereotypical			β: Non-stereotypical		
Indicator	**Conditions**	**Factor**	**b**	**SE**	**95% CI**	**z**	**p**	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Relevance, item 8	All stereotypical	Relevance	2.38	0.72	[0.97, 3.79]	3.31	< .001	0.80	0.74	0.70			
Relevance, item 8	All non-stereotypical	Relevance	0.93	0.32	[0.31, 1.56]	2.92	.003				0.30	0.33	0.33
Relevance, item 9	All stereotypical	Relevance	2.37	0.68	[1.04, 3.69]	3.50	< .001	0.73	0.69	0.76			
Relevance, item 9	All non-stereotypical	Relevance	2.17	0.52	[1.16, 3.19]	4.18	< .001				0.55	0.69	0.70
Relevance, item 10	All conditions	Relevance	1.10	0.39	[0.33, 1.86]	2.82	.005	0.35	0.36	0.34	0.34	0.36	0.37

Note. I fixed the loading for item position 2 (That Ms. Johnston experienced cramping and heavy bleeding at home.) at 1 in every condition to scale the factor. Other loadings followed the registered equality constraints. b = unstandardized loading; β = fully standardized loading within condition. SE, z, p, and 95% CIs are robust (Huber–White) Wald statistics for b.

Table 2-S4.8

All relevance products of the H2a model, by evidence condition, with the registered evidence differences

			Stereotypical		Non-stereotypical		Difference	
Pathway	**Type**	**Letter**	**b**	**95% CI**	**b**	**95% CI**	**b**	**95% CI**
SMA – None → Relevance → Abortion likelihood	single-mediator	H2a (non-stereotypical)	2.24	[−0.67, 5.82]	−1.51	[−4.98, 2.35]	3.75	[−1.09, 8.85]
SMA – None → Relevance → Miscarriage likelihood	single-mediator	H2b (non-stereotypical)	−2.79	[−7.40, 0.81]	1.88	[−3.11, 6.01]	−4.67	[−11.03, 1.45]
NCM – None → Relevance → Abortion likelihood	single-mediator	H2c (stereotypical)	0.93	[−1.97, 4.15]	−1.92	[−5.70, 1.29]	2.85	[−1.40, 7.93]
NCM – None → Relevance → Miscarriage likelihood	single-mediator	H2d (stereotypical)	−1.16	[−5.22, 2.43]	2.40	[−1.64, 7.04]	−3.56	[−9.93, 1.80]

Note. b = unstandardized product on the 0–100 likelihood scale (the outcome difference in relevance times the common relevance-to-likelihood slope). Letter = the registered confirmatory read (H2a–H2d) and the block it applies to; every other product and the evidence differences are reported without a support decision. Difference = stereotypical minus non-stereotypical product. The model's direct effects of outcome information are the likelihood intercept differences; the model estimates no total effect as a saved target, so none is shown. No SE or β is shown for a product: its registered interval is the percentile bootstrap interval. The products the Letter column names are the registered indirect effects of Table 2-S4.4, which gives their decisions.

Additional evidence–interpretation pathways (E1a)

Table 2-S4.9

Relevance and incrimination products of the E1a model, by evidence condition, with the evidence differences

Pathway	Type	Letter	Stereotypical		Non-stereotypical		Difference	
			b	95% CI	b	95% CI	b	95% CI
SMA – None → Relevance → Abortion likelihood	single-mediator	H2a (non-stereotypical)	−0.42	[−4.13, 1.65]	0.29	[−1.37, 3.53]	−0.70	[−6.65, 2.33]
SMA – None → Incrimination → Abortion likelihood	single-mediator		4.10	[−1.44, 11.67]	−0.02	[−6.11, 6.42]	4.13	[−3.95, 13.76]
SMA – None → Relevance + incrimination → Abortion likelihood	sum of the two single-mediator effects		3.69	[−1.66, 9.68]	0.26	[−5.25, 6.82]	3.42	[−5.03, 11.23]
SMA – None → Relevance → Miscarriage likelihood	single-mediator	H2b (non-stereotypical)	−1.31	[−5.78, 1.47]	0.90	[−3.10, 3.94]	−2.21	[−7.92, 3.13]
SMA – None → Incrimination → Miscarriage likelihood	single-mediator		−1.76	[−6.73, 0.83]	0.01	[−3.37, 3.13]	−1.77	[−7.66, 1.94]
SMA – None → Relevance + incrimination → Miscarriage likelihood	sum of the two single-mediator effects		−3.07	[−8.30, 0.85]	0.91	[−4.84, 4.97]	−3.98	[−10.55, 2.85]
NCM – None → Relevance → Abortion likelihood	single-mediator	H2c (stereotypical)	−0.11	[−2.51, 1.48]	0.46	[−1.68, 4.04]	−0.56	[−5.36, 2.16]
NCM – None → Incrimination → Abortion likelihood	single-mediator		1.36	[−3.78, 7.61]	−6.42	[−13.74, −0.61]	7.77	[0.16, 18.13]

Pathway	Type	Letter	Stereotypical		Non-stereotypical		Difference	
			b	95% CI	b	95% CI	b	95% CI
NCM – None → Relevance + incrimination → Abortion likelihood	sum of the two single-mediator effects		1.25	[−3.64, 6.59]	−5.96	[−12.04, −0.29]	7.21	[−0.12, 15.72]
NCM – None → Relevance → Miscarriage likelihood	single-mediator	H2d (stereotypical)	−0.34	[−3.30, 2.02]	1.44	[−1.83, 5.66]	−1.78	[−7.32, 2.43]
NCM – None → Incrimination → Miscarriage likelihood	single-mediator		−0.58	[−4.05, 1.95]	2.75	[−0.61, 8.06]	−3.33	[−10.38, 0.78]
NCM – None → Relevance + incrimination → Miscarriage likelihood	sum of the two single-mediator effects		−0.92	[−5.22, 2.89]	4.19	[−0.30, 9.27]	−5.11	[−11.77, 0.65]

Note. b = unstandardized product on the 0–100 likelihood scale: the outcome difference in each factor (its SMA or NCM intercept; the no-information intercept is fixed at 0) times that factor's likelihood slope, controlling for the other factor; slopes are common to the six conditions. Sum = relevance plus incrimination product. Difference = stereotypical minus non-stereotypical. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per product: 9992 (failed attempts are not replaced). Scaled fit of the whole model: scaled $\chi^2(1838) = 3698.21$, $p < .001$, CFI = 0.625, TLI = 0.602, RMSEA = 0.138 (90% CI [0.131, 0.144]), SRMR = 0.164. Residual covariances estimated separately in each condition, as registered: the factor residual covariance and the ten covariances between the relevance and incrimination ratings of the same fact, shown in the covariance table below and not drawn in the figure.

Figure 2-S4.2

Fitted chains of the parallel relevance and incrimination model (E1a)

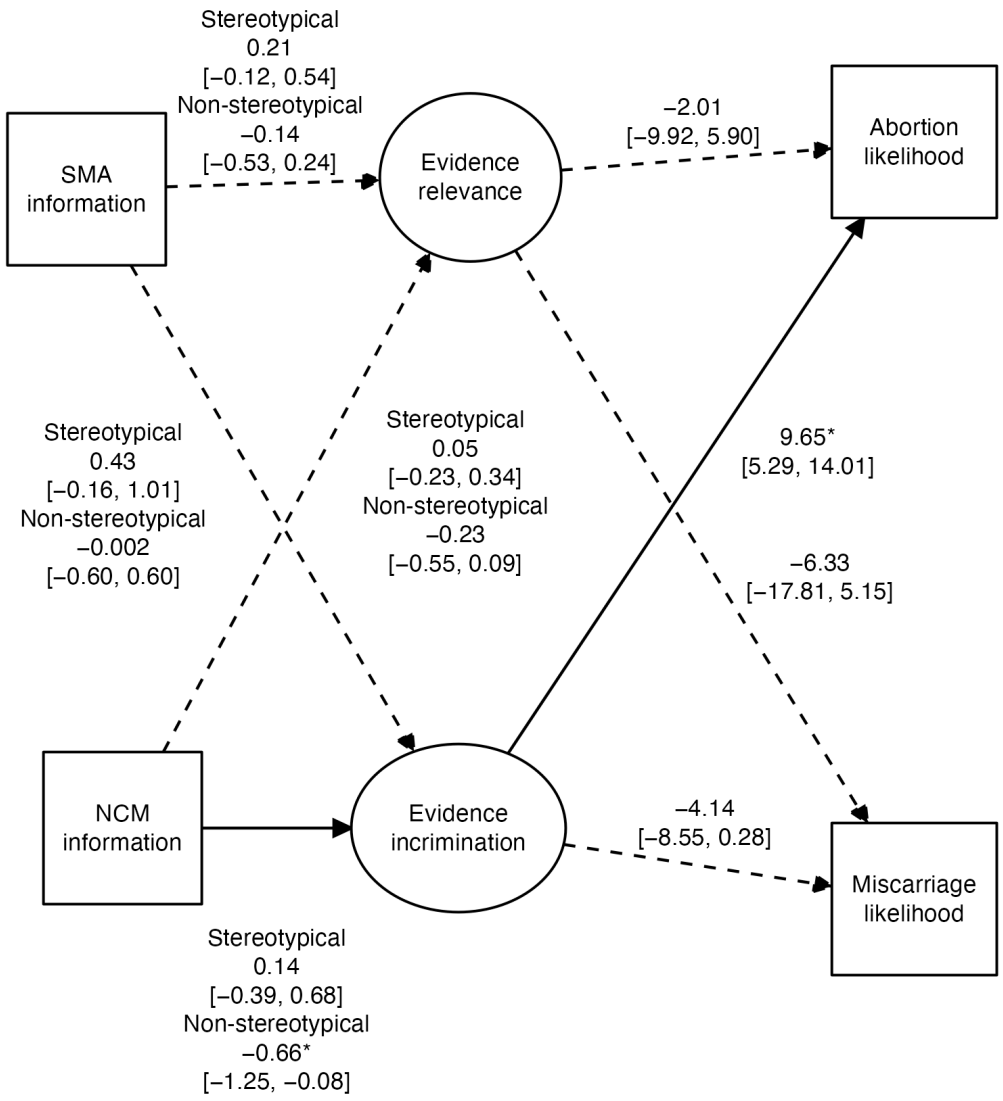

Table 2-S4.10

Factor residual covariance and same-fact residual covariances by condition, E1a model (primary sample, adjusted)

Variance: participant intercept	1.35				

Term	b	SE	t	p	95% CI
Variance: residual	4.09				

Note. Separate means for each item position in each of the six conditions, four common attitude slopes, a participant random intercept and a common residual variance; restricted maximum likelihood, as registered. Item positions name different facts in the two evidence versions where the fact is version-unique (fact key in S2 and in the difference table below). Fixed effects: b (SE) with Wald 95% CIs and Satterthwaite-df t tests from the fitted model; these describe the model and are not the registered read, which is the forty differences below with their percentile bootstrap intervals. ICC = 0.248; marginal and conditional R-squared 0.318 and 0.487 (approximated as the package states). Singular fit: no.

Table 2-S4.12

E1b: SMA and NCM information compared with None for each fact, within each evidence condition

Contrast	Difference	95% percentile CI	Usable attempts
Stereotypical evidence, position 1: That an anonymous coworker reported Ms. Johnston had said she used pills ordered online to handle it at home.			
SMA – None	0.84	[−0.01, 1.67]	10000 of 10000
NCM – None	0.34	[−0.52, 1.21]	10000 of 10000
Stereotypical evidence, position 2: That Ms. Johnston experienced cramping and heavy bleeding at home.			
SMA – None	−0.14	[−0.94, 0.68]	10000 of 10000
NCM – None	0.32	[−0.47, 1.12]	10000 of 10000
Stereotypical evidence, position 3: That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.			
SMA – None	0.02	[−0.68, 0.74]	10000 of 10000
NCM – None	0.04	[−0.65, 0.76]	10000 of 10000
Stereotypical evidence, position 4: That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.			
SMA – None	0.35	[−0.36, 1.09]	10000 of 10000
NCM – None	0.10	[−0.62, 0.87]	10000 of 10000

Contrast	Difference	95% percentile CI	Usable attempts
Stereotypical evidence, position 5: That Ms. Johnston did not call 911 or seek in-person medical care.			
SMA – None	0.76	[−0.01, 1.52]	10000 of 10000
NCM – None	0.38	[−0.41, 1.17]	10000 of 10000
Stereotypical evidence, position 6: That Ms. Johnston was 18 years old, unmarried, and had no children.			
SMA – None	0.19	[−0.79, 1.19]	10000 of 10000
NCM – None	0.13	[−0.84, 1.10]	10000 of 10000
Stereotypical evidence, position 7: That Ms. Johnston lived with a roommate, who was out of town on the day of the event.			
SMA – None	0.09	[−0.77, 0.97]	10000 of 10000
NCM – None	0.04	[−0.82, 0.87]	10000 of 10000
Stereotypical evidence, position 8: That Ms. Johnston did not tell anyone on the day of the event.			
SMA – None	0.33	[−0.63, 1.25]	10000 of 10000
NCM – None	0.32	[−0.63, 1.27]	10000 of 10000
Stereotypical evidence, position 9: That Ms. Johnston kept a hair appointment that afternoon and worked her shifts over the next two days.			
SMA – None	0.55	[−0.42, 1.52]	10000 of 10000
NCM – None	0.29	[−0.66, 1.22]	10000 of 10000
Stereotypical evidence, position 10: That Detective Snyder had 14 years of experience with the Millfield Police Department.			
SMA – None	0.74	[−0.18, 1.65]	10000 of 10000
NCM – None	0.41	[−0.55, 1.34]	10000 of 10000
Non-stereotypical evidence, position 1: That an anonymous coworker reported Ms. Johnston had said she handled it at home by herself.			
SMA – None	−0.51	[−1.48, 0.40]	10000 of 10000
NCM – None	−0.13	[−0.93, 0.68]	10000 of 10000
Non-stereotypical evidence, position 2: That Ms. Johnston experienced cramping and heavy bleeding at home.			
SMA – None	−0.39	[−1.16, 0.40]	10000 of 10000
NCM – None	−0.35	[−1.20, 0.47]	10000 of 10000

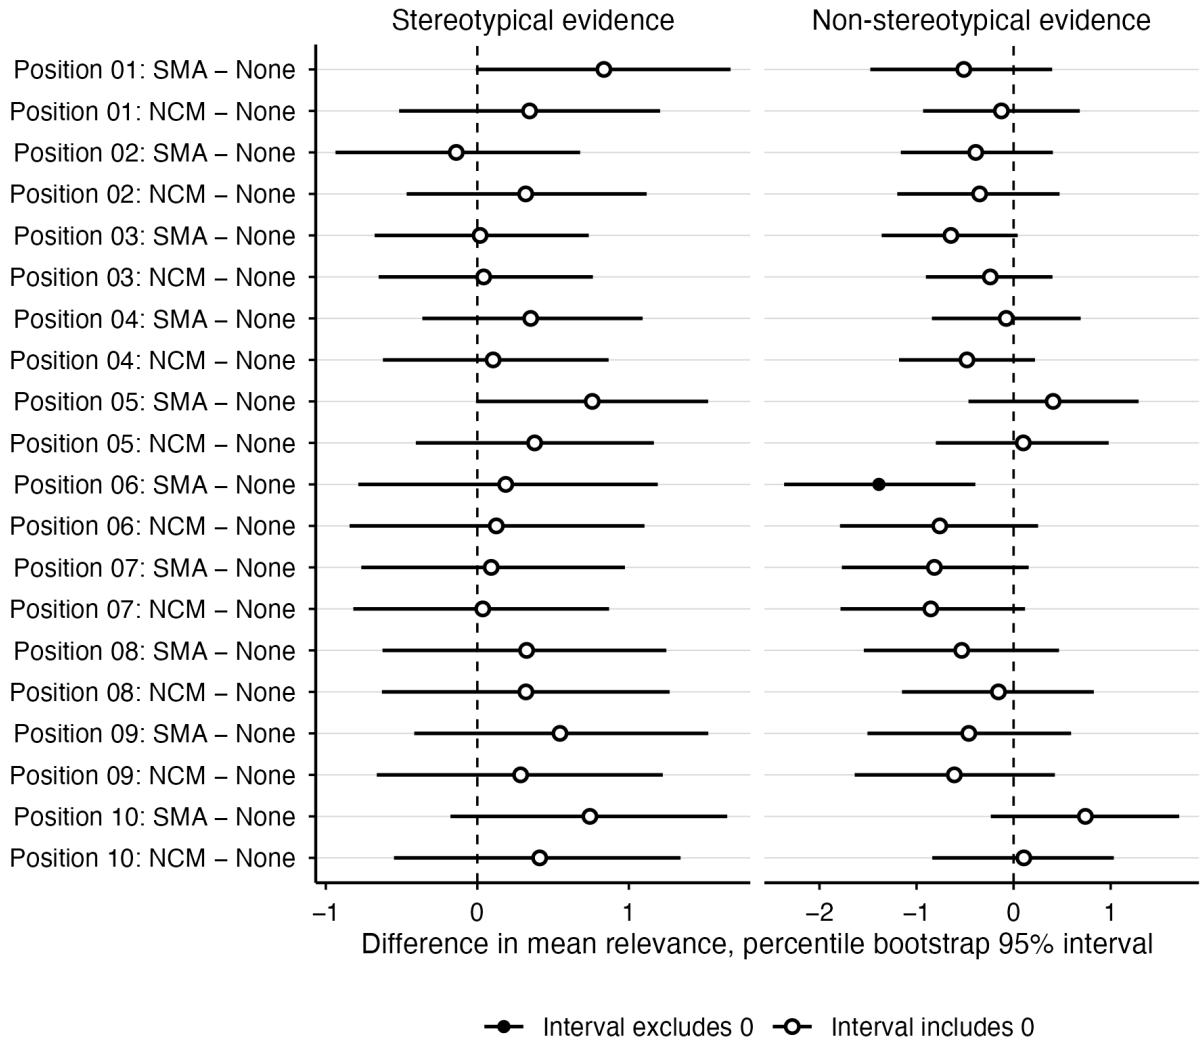

Contrast	Difference	95% percentile CI	Usable attempts
Non-stereotypical evidence, position 3: That Ms. Johnston said the pregnancy passed in the bathroom, that she panicked and flushed the toilet, disposing of the remains through the residential plumbing.			
SMA – None	−0.65	[−1.36, 0.04]	10000 of 10000
NCM – None	−0.24	[−0.90, 0.40]	10000 of 10000
Non-stereotypical evidence, position 4: That fetal remains were recovered from the residential plumbing, consistent with a fetus of approximately 20 weeks.			
SMA – None	−0.08	[−0.84, 0.69]	10000 of 10000
NCM – None	−0.48	[−1.18, 0.22]	10000 of 10000
Non-stereotypical evidence, position 5: That Ms. Johnston did not call 911 or seek in-person medical care.			
SMA – None	0.41	[−0.46, 1.29]	10000 of 10000
NCM – None	0.10	[−0.80, 0.98]	10000 of 10000
Non-stereotypical evidence, position 6: That Ms. Johnston was 31 years old, married, and had two school-age children.			
SMA – None	−1.39	[−2.36, −0.39]	10000 of 10000
NCM – None	−0.76	[−1.79, 0.25]	10000 of 10000
Non-stereotypical evidence, position 7: That Ms. Johnston lived with her husband and two children, who were at work and at school on the day of the event.			
SMA – None	−0.82	[−1.77, 0.16]	10000 of 10000
NCM – None	−0.85	[−1.78, 0.12]	10000 of 10000
Non-stereotypical evidence, position 8: That Ms. Johnston told her husband on the day of the event.			
SMA – None	−0.53	[−1.54, 0.47]	10000 of 10000
NCM – None	−0.16	[−1.15, 0.83]	10000 of 10000
Non-stereotypical evidence, position 9: That Ms. Johnston completed school pickup that afternoon and worked her shifts over the next two days while managing school drop-off and pickup.			
SMA – None	−0.46	[−1.51, 0.59]	10000 of 10000
NCM – None	−0.61	[−1.64, 0.43]	10000 of 10000
Non-stereotypical evidence, position 10: That Detective Snyder had 14 years of experience with the Millfield Police Department.			
SMA – None	0.74	[−0.24, 1.71]	10000 of 10000

Contrast	Difference	95% percentile CI	Usable attempts
NCM – None	0.11	[−0.84, 1.03]	10000 of 10000

Note. Difference in mean relevance (rating scale of the items) between SMA or NCM information and None, for the same fact within an evidence condition, from the REML model above. Percentile bootstrap 95% intervals from within-condition participant resamples; bootstrap duplicates keep all their ratings under distinct participant identifiers. Resamples: 10000; usable attempts per difference: 10000. No directional item-set score, equivalence decision or random item-population inference (registered).

Figure 2-S4.3

E1b item differences with their percentile bootstrap intervals, by evidence condition

S5. Moral judgments of the plaintiff (RQ2)

Notes shared by tables of this section.

- Tables 2-S5.1 to 2-S5.3, 2-S5.5, 2-S5.6 and 2-S5.8: *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).
- Tables 2-S5.3 and 2-S5.4: Auxiliary items enter the adjusted model only when a model variable is missing; none is missing in the study sample, so the production model is fitted without them.

Differences across judgments (H3a–H3b)

Table 2-S5.1

Adjusted means of the eight plaintiff judgments by condition, from the H3a and H3b fits (primary sample, adjusted)

	Stereotypical			Non-stereotypical		
Judgment: M [95% CI]	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Moral judgments (H3a)						
Deserved punishment	3.07 [2.66, 3.48]	2.99 [2.56, 3.42]	2.60 [2.21, 2.99]	2.74 [2.31, 3.16]	2.45 [2.02, 2.88]	2.25 [1.82, 2.68]
Plaintiff blame	3.83 [3.37, 4.29]	4.58 [4.10, 5.05]	3.34 [2.90, 3.78]	3.55 [3.08, 4.02]	4.27 [3.79, 4.75]	3.04 [2.56, 3.52]
Wrongness	3.66 [3.21, 4.12]	3.90 [3.43, 4.37]	3.36 [2.92, 3.80]	3.33 [2.86, 3.80]	3.77 [3.30, 4.25]	3.20 [2.73, 3.68]
Sympathy (reverse-scored)	3.20 [2.77, 3.62]	3.67 [3.23, 4.10]	2.89 [2.48, 3.30]	3.10 [2.66, 3.53]	3.39 [2.94, 3.83]	2.68 [2.24, 3.13]
Mental states (H3b)						
Purpose	3.82 [3.41, 4.23]	5.16 [4.74, 5.59]	3.35 [2.95, 3.75]	3.23 [2.81, 3.65]	4.57 [4.15, 4.99]	2.76 [2.34, 3.18]

	Stereotypical			Non-stereotypical		
Judgment: M [95% CI]	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Knowledge	3.77 [3.39, 4.15]	4.92 [4.53, 5.31]	3.31 [2.94, 3.68]	3.29 [2.90, 3.67]	4.44 [4.05, 4.83]	2.83 [2.44, 3.21]
Recklessness	4.26 [3.89, 4.63]	5.48 [5.10, 5.86]	3.91 [3.56, 4.27]	3.81 [3.43, 4.18]	5.03 [4.65, 5.40]	3.46 [3.09, 3.84]
Negligence	4.61 [4.24, 4.99]	5.73 [5.34, 6.11]	4.05 [3.69, 4.42]	4.01 [3.63, 4.39]	5.12 [4.74, 5.51]	3.45 [3.06, 3.83]

Note. Adjusted means on the 1–7 scale with Student t 95% intervals from each fit's coefficient covariance and residual df; attitudes at their means in each model. The H3a model has a mean for each of the six conditions; the H3b model is additive in outcome and evidence (no interaction), so its six means are model-implied from the effects-coded terms.

Table 2-S5.2

Moral-judgment synthesis: the H3a contrast and its constituent SMA – NCM estimates (primary sample, adjusted)

Estimate	SMA – NCM	SE	t	df	p	95% CI
Deserved punishment	0.30	0.21	1.38	310	.168	[−0.13, 0.72]
Plaintiff blame	1.23	0.24	5.18	310	< .001	[0.76, 1.70]
Wrongness	0.55	0.24	2.34	310	.020	[0.09, 1.02]
Sympathy (reverse-scored)	0.74	0.22	3.35	310	< .001	[0.31, 1.17]
Mean of blame, wrongness and reverse-scored sympathy	0.84	0.19	4.34	310	< .001	[0.46, 1.22]
Punishment minus that mean (the H3a contrast)	−0.55	0.15	−3.56	310	< .001	[−0.85, −0.24]

Note. H3a estimates came from one fit (N = 320), with evidence conditions weighted equally: each SMA – NCM difference, the mean of the three comparison judgments, and the registered contrast. Estimates are in rating points (1–7 scale), with 95% Student t intervals from the full coefficient covariance. Descriptive estimates; no support decision.

Likelihood, mental states and plaintiff moral judgments (H3c; E2a–E2d)

Table 2-S5.3

All SMA – NCM products of the joint plaintiff model by judgment, with the registered constituent paths and the between-judgment differences

Pathway	Type	Letter	b	95% percentile CI	Usable attempts
Plaintiff blame (1–7)					
SMA – NCM → likelihood → negligence → plaintiff blame	two-mediator serial	H3c	0.144	[0.039, 0.310]	10000 of 10000
SMA – NCM → likelihood → recklessness → plaintiff blame	two-mediator serial	E2a	0.111	[−0.044, 0.276]	10000 of 10000
SMA – NCM → negligence → plaintiff blame	single-mediator		0.256	[0.065, 0.517]	10000 of 10000

SMA – NCM → negligence → wrongness	single-mediator		0.361	[0.137, 0.622]	10000 of 10000
SMA – NCM → recklessness → wrongness	single-mediator		0.029	[−0.165, 0.227]	10000 of 10000
SMA – NCM → likelihood → wrongness	single-mediator		0.275	[0.072, 0.510]	10000 of 10000
Through negligence (serial plus shorter) → wrongness	sum of two specific effects		0.563	[0.250, 0.903]	10000 of 10000
Through recklessness (serial plus shorter) → wrongness	sum of two specific effects		0.053	[−0.289, 0.409]	10000 of 10000
Negligence minus recklessness contribution, wrongness	difference of two sums		0.511	[−0.078, 1.130]	10000 of 10000
Total indirect effect on wrongness	total indirect		0.891	[0.579, 1.214]	10000 of 10000
Direct effect on wrongness	direct		−0.372	[−0.837, 0.104]	10000 of 10000
Total effect on wrongness	total		0.519	[0.024, 1.002]	10000 of 10000
Between judgments					
combined negligence: plaintiff blame minus deserved punishment	difference between judgments		0.035	[−0.243, 0.363]	10000 of 10000

Pathway	Type	Letter	b	95% percentile CI	Usable attempts
combined negligence: plaintiff blame minus wrongness	difference between judgments		−0.163	[−0.474, 0.188]	10000 of 10000
combined negligence: deserved punishment minus wrongness	difference between judgments		−0.198	[−0.493, 0.082]	10000 of 10000
combined recklessness: plaintiff blame minus deserved punishment	difference between judgments		0.092	[−0.228, 0.385]	10000 of 10000
combined recklessness: plaintiff blame minus wrongness	difference between judgments		0.192	[−0.205, 0.566]	10000 of 10000
combined recklessness: deserved punishment minus wrongness	difference between judgments		0.100	[−0.227, 0.422]	10000 of 10000
serial negligence: plaintiff blame minus deserved punishment	difference between judgments		0.013	[−0.089, 0.148]	10000 of 10000
serial negligence: plaintiff blame minus wrongness	difference between judgments		−0.059	[−0.181, 0.069]	10000 of 10000
serial negligence: deserved punishment minus wrongness	difference between judgments		−0.071	[−0.197, 0.029]	10000 of 10000
serial recklessness: plaintiff blame minus deserved punishment	difference between judgments		0.042	[−0.113, 0.178]	10000 of 10000
serial recklessness: plaintiff blame minus wrongness	difference between judgments		0.087	[−0.100, 0.262]	10000 of 10000
serial recklessness: deserved punishment minus wrongness	difference between judgments		0.045	[−0.105, 0.201]	10000 of 10000

Pathway	Type	Letter	b	95% percentile CI	Usable attempts
Registered constituent paths					
Likelihood → negligence (dN)	common slope		0.028	[0.022, 0.036]	10000 of 10000
Likelihood → recklessness (dR)	common slope		0.033	[0.027, 0.041]	10000 of 10000
Negligence → plaintiff blame (bNB)	common slope		0.243	[0.074, 0.445]	10000 of 10000
Recklessness → plaintiff blame (bRB)	common slope		0.159	[−0.063, 0.357]	10000 of 10000

Note. b = unstandardized estimate. Products = SMA − NCM differences in judgment points (1–7 scale) at the pooled reference; constituent slopes were equal across six conditions. Confirmatory: H3c; exploratory: E2a–E2d. Other rows were descriptive, with no directional predictions for punishment or wrongness. All 10,000 participant resamples within conditions were usable; 95% CIs are percentile bootstrap intervals. Serial = through likelihood, then mental state; shorter = through mental state alone. Primary sample, adjusted.

Table 2-S5.4

Global fit of the joint plaintiff model in the four sample and adjustment versions: scaled test statistic and indices as saved by the analysis

Version	N	chi2	df	p	chi2/ df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
Primary, adjusted	320	73.64	55	.047	1.34	0.988	0.939	0.080	[0.009, 0.124]	0.054
Primary, unadjusted	320	67.15	55	.126	1.22	0.986	0.977	0.064	[0.000, 0.112]	0.148
Sensitivity, adjusted	212	128.71	55	< .001	2.34	0.938	0.696	0.195	[0.149, 0.241]	0.093
Sensitivity, unadjusted	212	105.08	55	< .001	1.91	0.928	0.882	0.161	[0.112, 0.208]	0.218

Note. χ^2 is the Yuan–Bentler scaled χ^2 (MLR; lavaan test yuan.bentler.mplus), with df and p. CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation, with 90% CI; SRMR = standardized root mean square residual. CFI, TLI, and RMSEA use scaled χ^2. RMSEA 90% CIs are scaled, rather than robust, intervals for six groups. The registered fits use lavaan estimator ML with robust.huber.white standard errors, test none, and missing = ml, giving robust maximum-likelihood estimation with FIML. Fit statistics for plaintiff-pathways primary adjusted, primary unadjusted, sensitivity adjusted, and sensitivity unadjusted come from fit-statistics-only refits using the estimator's default test at the registered estimates (largest difference: 0). The registration sets no fit cutoffs. N counts eligible participants.

Note. b is unstandardized; β is lavaan std.all, standardized within condition. SE, z, p, and the 95% CI are robust (Huber-White) Wald statistics on b. Conditions identifies rows shared under registered equalities: substantive slopes are equal across all six conditions, whereas attitude slopes are free. Parameters that differ across conditions have separate rows; β appears within each condition covered by a row.

Outcome comparisons on each plaintiff judgment (H3d–H3g)

Table 2-S5.6

Adjusted means of recklessness and negligence by condition (primary sample, adjusted)

	Stereotypical			Non-stereotypical		
Judgment: M [95% CI]	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Recklessness	4.27 [3.83, 4.72]	5.50 [5.04, 5.97]	3.88 [3.45, 4.31]	3.79 [3.33, 4.26]	5.00 [4.53, 5.47]	3.50 [3.03, 3.97]
Negligence	4.58 [4.12, 5.03]	5.71 [5.24, 6.19]	4.10 [3.66, 4.54]	4.05 [3.58, 4.52]	5.14 [4.66, 5.62]	3.39 [2.91, 3.87]

Note. Adjusted means on the 1–7 scale at the covariate means, from emmeans on each saved ANCOVA, with Student t 95% intervals. The adjusted means of plaintiff blame and deserved punishment are those of Table 2-S5.1 and are printed there.

Table 2-S5.7

ANCOVA source tables for the four plaintiff judgments (primary sample, adjusted)

Source	F	df1	df2	p	partial_eta2	90% CI

evidence	9.68	1	310	.002	.030	[.011, 1.000]
outcome	25.46	2	310	< .001	.141	[.095, 1.000]
Abortion attitudes	0.01	1	310	.917	.000	[.000, 1.000]
Punishment support	7.33	1	310	.007	.023	[.006, 1.000]
Hostile sexism	3.12	1	310	.078	.010	[.000, 1.000]
Benevolent sexism	0.68	1	310	.412	.002	[.000, 1.000]
evidence:outcome	0.08	2	310	.924	.001	[.000, 1.000]

Note. Analysis of covariance (ANCOVA) with abortion attitudes, support for punishment, hostile sexism, and benevolent sexism as covariates. Type-II F-tests have partial eta-squared (η^2_p) and noncentral F 90% CIs. I omit sums of squares and mean squares. emmeans gives adjusted means at the covariate mean(s). The evidence × outcome row equals the Wald F calculated from the interaction coefficients and their covariance. The registered SMA – NCM comparison proceeds regardless of these tests.

Orderings in the mental-state ratings (E2e–E2g)

Table 2-S5.8

Culpability orderings in the mental-state ratings, within each outcome condition and pooled, read from the H3b fit (E2e–E2g)

Scope	Letter	Estimate	SE	t	df	p	95% CI	Pooled estimate interpreted	Decision
Purpose – knowledge									
SMA		0.19	0.11	1.68	312	.094	[−0.03, 0.40]		
NCM		−0.01	0.11	−0.12	312	.902	[−0.22, 0.20]		
None		−0.003	0.11	−0.02	312	.981	[−0.21, 0.21]		
Pooled (six conditions weighted equally)	E2e	0.06	0.06	0.91	312	.362	[−0.07, 0.18]	no: the ordering changes sign across outcome conditions	not interpreted (the ordering changes sign across the outcome conditions)
Recklessness – negligence									
SMA		−0.17	0.10	−1.68	312	.094	[−0.37, 0.03]		
NCM		−0.06	0.10	−0.62	312	.534	[−0.25, 0.13]		
None		−0.28	0.10	−2.76	312	.006	[−0.47, −0.08]		
Pooled (six conditions weighted equally)	E2f	−0.17	0.06	−2.94	312	.004	[−0.28, −0.06]	yes	not supported by all registered criteria
Knowledge – recklessness									
SMA		−0.57	0.11	−5.20	312	< .001	[−0.79, −0.35]		
NCM		−0.62	0.10	−5.90	312	< .001	[−0.83, −0.41]		
None		−0.51	0.11	−4.75	312	< .001	[−0.72, −0.30]		

Scope	Letter	Estimate	SE	t	df	p	95% CI	Pooled estimate interpreted	Decision
SMA minus NCM	E2g	0.05	0.15	0.32	312	.746	[−0.25, 0.35]		not supported by all registered criteria

Note. Differences in adjusted means between two mental-state ratings (1–7 scale) from the H3b effects-coded multivariate ANCOVA, at the pooled attitude means and weighting evidence conditions equally within each outcome condition; the pooled row weights all six conditions equally. E2g's registered read is the SMA – NCM difference of the knowledge – recklessness difference. Student t 95% intervals use the same coefficient covariance and residual df; primary sample, adjusted. Letter identifies the registered decision row: pooled E2e and E2f, or SMA minus NCM for E2g. Condition-specific rows supply no support decision. As registered, I report but do not interpret the pooled estimate when an ordering reverses across outcome conditions. The interpretation column flags the reversal, and the letter's decision reflects it.

S6. Evaluations of the officer (RQ3)

Notes shared by tables of this section.

- Tables 2-S6.1 and 2-S6.4: Decision: each letter's registered rule applied to its saved interval.
- Tables 2-S6.1, 2-S6.2, 2-S6.4 and 2-S6.5: *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).

Evaluations of the officer (H4a–H4h)

Table 2-S6.1

Outcome information and the four evaluations of the officer: registered comparisons with None (H4a–H4h)

Reported here rather than in the dissertation chapter, which points to this supplement.

Contrast	Letter	Predicted direction	Estimate	SE	t	df	p	95% CI	Decision
Decision quality (1–7)									
SMA – None	H4a	above zero	0.33	0.22	1.52	310	.129	[−0.10, 0.76]	not supported by all registered criteria
NCM – None	H4b	below zero	0.01	0.21	0.07	310	.947	[−0.41, 0.43]	not supported by all registered criteria
Officer blame (0–10)									
SMA – None	H4c	below zero	−0.26	0.44	−0.60	310	.548	[−1.13, 0.60]	not supported by all registered criteria

Contrast	Letter	Predicted direction	Estimate	SE	t	df	p	95% CI	Decision
NCM – None	H4d	above zero	−0.15	0.43	−0.34	310	.733	[−0.99, 0.70]	not supported by all registered criteria
Deserved consequences (0–10)									
SMA – None	H4e	below zero	−0.69	0.40	−1.74	310	.083	[−1.47, 0.09]	not supported by all registered criteria
NCM – None	H4f	above zero	0.20	0.39	0.52	310	.605	[−0.56, 0.96]	not supported by all registered criteria
Arrest wrongness (0–10)									
SMA – None	H4g	below zero	−0.39	0.41	−0.95	310	.344	[−1.20, 0.42]	not supported by all registered criteria
NCM – None	H4h	above zero	0.25	0.40	0.63	310	.532	[−0.54, 1.04]	not supported by all registered criteria

Note. Adjusted-mean differences from the full ANCOVA of each evaluation (evidence, outcome information and their interaction, four attitude covariates with common slopes, pooled residual variance), primary sample, adjusted. Each comparison weights the two evidence conditions equally. Student t tests and 95% t intervals from the full OLS coefficient covariance with the residual df; no adjustment for multiple comparisons (registered). Predicted direction = the registered sign; each letter's rule reads its own interval against zero in that direction, with no joint-support rule. Overall test of outcome information in each ANCOVA (Type II F, reported regardless of the comparisons, as registered): the Outcome information rows of the adjusted bands of Table 2-S6.3.

Table 2-S6.2

Adjusted means of the four evaluations by condition, adjusted and unadjusted ANCOVAs (primary sample)

	Stereotypical			Non-stereotypical		
Evaluation: M [95% CI]	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Adjusted for the four attitudes						
Decision quality (1–7)	3.62 [3.20, 4.03]	4.10 [3.67, 4.53]	3.75 [3.35, 4.15]	3.47 [3.04, 3.90]	3.65 [3.21, 4.08]	3.37 [2.93, 3.80]
Officer blame (0–10)	5.90 [5.06, 6.73]	5.02 [4.15, 5.89]	5.38 [4.57, 6.18]	5.39 [4.52, 6.25]	5.73 [4.85, 6.61]	5.61 [4.74, 6.49]
Deserved consequences (0–10)	4.40 [3.65, 5.16]	3.02 [2.24, 3.80]	4.07 [3.35, 4.80]	4.04 [3.26, 4.82]	4.05 [3.25, 4.84]	4.77 [3.98, 5.56]
Arrest wrongness (0–10)	5.51 [4.72, 6.29]	4.71 [3.89, 5.52]	5.29 [4.54, 6.04]	5.43 [4.62, 6.24]	5.45 [4.63, 6.28]	6.15 [5.34, 6.97]
Unadjusted						
Decision quality (1–7)	3.58 [3.09, 4.08]	4.11 [3.60, 4.62]	3.74 [3.27, 4.22]	3.35 [2.84, 3.86]	3.65 [3.13, 4.17]	3.52 [3.00, 4.03]
Officer blame (0–10)	5.95 [4.99, 6.90]	4.94 [3.96, 5.92]	5.40 [4.49, 6.31]	5.62 [4.63, 6.60]	5.72 [4.72, 6.72]	5.39 [4.40, 6.38]
Deserved consequences (0–10)	4.45 [3.62, 5.29]	2.94 [2.08, 3.80]	4.07 [3.26, 4.87]	4.23 [3.37, 5.09]	4.04 [3.16, 4.92]	4.61 [3.74, 5.48]
Arrest wrongness (0–10)	5.56 [4.66, 6.47]	4.63 [3.70, 5.57]	5.28 [4.42, 6.15]	5.63 [4.70, 6.57]	5.46 [4.51, 6.41]	5.96 [5.02, 6.90]

Note. Each entry is the adjusted mean [95% t interval] from emmeans on the saved ANCOVA (adjusted: at the attitude means; unadjusted: the condition means), with the model's residual df. Each registered comparison is the difference of the equal-evidence averages of these means.

Table 2-S6.3

Omnibus source tables of the four ANCOVAs, adjusted and unadjusted (primary sample)

Source	F	df1	df2	p	Partial η²	90% CI

Note. Analysis of covariance (ANCOVA) with abortion attitudes, support for punishment, hostile sexism, and benevolent sexism as covariates. Type-II F-tests. Partial η^2 = partial eta-squared (η^2_p) with its 90% CI (noncentral F). Sums of squares and mean squares are omitted; the full source table is available on request. Adjusted means estimated at covariate mean(s) via emmeans. The adjusted bands are the full ANCOVAs with the four attitude covariates. The unadjusted bands are the two-way ANOVAs without covariates. The registered reads are the comparisons in the tables above, not these F tests.

Figure 2-S6.1

Adjusted mean evaluations of the officer: None against SMA and NCM information, averaged over the two evidence conditions

Reported here rather than in the dissertation chapter, which points to this supplement.

Foreseeability, officer blame and deserved consequences (E3a–E3d)

Table 2-S6.4

Registered quantities of the officer path model: coefficients, products and the remaining direct SMA − NCM difference (E3a–E3d)

Quantity	Type	Letter	Predicted direction	Adjusted		Unadjusted		Usable attempts	Decision
				b	95% CI	b	95% CI		
Path coefficients (robust Wald 95% CI)									
Foreseeability → officer blame, SMA information	coefficient (equal across evidence)	E3a	below zero	−0.45	[−1.09, 0.18]	−0.55	[−1.30, 0.20]		not supported by all registered criteria
Foreseeability → officer blame, NCM information	coefficient (equal across evidence)	E3b	above zero	0.08	[−0.55, 0.71]	−0.29	[−0.99, 0.41]		not supported by all registered criteria
Foreseeability → officer blame, None	coefficient (equal across evidence)		none registered	0.000	[−0.65, 0.65]	−0.56	[−1.41, 0.28]		reported without a registered read
Officer blame → deserved consequences, all six conditions	coefficient (common)	E3c	above zero	0.65	[0.58, 0.72]	0.69	[0.63, 0.75]		supported

Quantity	Type	Letter	Predicted direction	Adjusted b	Adjusted 95% CI	Unadjusted b	Unadjusted 95% CI	Usable attempts	Decision
Products and the remaining direct difference (percentile bootstrap 95% CI)									
Foreseeability → officer blame → deserved consequences, SMA information	single-mediator product		none registered	−0.30	[−0.75, 0.21]	−0.38	[−0.92, 0.16]	10000 of 10000	reported without a registered read
Foreseeability → officer blame → deserved consequences, NCM information	single-mediator product		none registered	0.05	[−0.37, 0.53]	−0.20	[−0.71, 0.30]	10000 of 10000	reported without a registered read
Foreseeability → officer blame → deserved consequences, None	single-mediator product		none registered	0.000	[−0.48, 0.46]	−0.39	[−1.01, 0.20]	10000 of 10000	reported without a registered read

Quantity	Type	Letter	Predicted direction	Adjusted		Unadjusted		Usable attempts	Decision
				b	95% CI	b	95% CI		
Remaining direct difference in deserved consequences, SMA − NCM	direct outcome difference	E3d	below zero	−0.75	[−1.31, −0.25]	−0.75	[−1.28, −0.26]	10000 of 10000	supported

Note. b = unstandardized estimate, primary sample; Adjusted = with the four attitudes (and error preference in the consequence equation); Unadjusted = without them. Coefficients: the labeled parameters of the registered three-equation model, with robust (Huber-White) Wald 95% intervals; the foreseeability-to-blame coefficient is equal across the two evidence conditions within each outcome, and the blame-to-consequence coefficient is common to the six conditions, as registered. Products: the foreseeability-to-blame coefficient under each outcome times the common blame-to-consequence coefficient. Remaining direct difference: the analysis's average, over the included SMA and NCM participants in their own evidence condition, of the consequence equation's condition-specific terms under SMA minus under NCM (the common blame and error-preference terms cancel). Both take percentile bootstrap 95% intervals. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 10000 (failed attempts are not replaced). lavaan estimator MLR (estimator ML with robust.huber.white standard errors, missing = ml). Scaled fit of the adjusted model: scaled $\chi^2(25) = 24.31$, $p = .501$, CFI = 1.000, TLI = 1.007, RMSEA = 0.000 (90% CI [0.000, 0.106]), SRMR = 0.038. No model variable was missing, so no auxiliary items were used. Letter = the registered read; the no-information coefficient and the three products carry no registered direction and are reported without a support gate.

							β: Stereotypical			β: Non-stereotypical		
Predictor	**Conditions**	**b**	**SE**	**z**	**p**	**95% CI**	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Benevolent sexism	Non-stereotypical, NCM	0.46	0.19	2.36	.018	[0.08, 0.84]						0.19

Note. b = unstandardized coefficient; β = standardized coefficient (lavaan std.all, within condition). SE, z, p and the 95% CI are robust (Huber-White) Wald statistics on b. Conditions = the conditions that share the row's b, SE, z, p and interval, by the registered equality the saved labels carry. A parameter that differs between conditions has a row for each; β, standardized within condition, is printed under each condition a row covers.

Figure 2-S6.2

Fitted chain of the officer model: foreseeability to officer blame to deserved consequences (E3a–E3c)

S7. Legal decisions (RQ4)

Notes shared by tables of this section.

- Tables 2-S7.1, 2-S7.3, 2-S7.7 and 2-S7.12: Decision: each letter's registered rule applied to its saved interval.
- Tables 2-S7.1 to 2-S7.4, 2-S7.7, 2-S7.9, 2-S7.10 and 2-S7.12: *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).
- Tables 2-S7.3 and 2-S7.12: In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).
- Tables 2-S7.5 and 2-S7.13: *N* = 319 (Stereotypical, None, *n* = 54; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51); complete cases on the analyzed variables.

Probable-cause rulings (H5a, H5b, E4a, E4b)

Table 2-S7.1

Additional probable-cause comparisons: NCM – None and SMA – NCM from the basic model (E4a) and the stereotypical – non-stereotypical difference of the remaining SMA – NCM difference (E4b)

Comparison	Letter	Predicted direction	Δp	95% percentile CI	Usable attempts	Decision
Basic model (all six conditions; H5a, E4a)						
NCM – None	E4a	none registered	−.02	[−.13, .10]	10000 of 10000	estimates reported; no registered decision rule
SMA – NCM	E4a	none registered	.13	[.01, .25]	10000 of 10000	estimates reported; no registered decision rule
Model with likelihood and foreseeability (SMA and NCM profiles; H5b, E4b)						

Comparison	Letter	Predicted direction	Δp	95% percentile CI	Usable attempts	Decision
(SMA – NCM, stereotypical) – (SMA – NCM, non-stereotypical)	E4b	above zero	.02	[−.20, .24]	10000 of 10000	not supported by all registered criteria

Note. Δp = difference in the average predicted probability of a yes ruling, primary sample, adjusted. E4a reuses the H5a model and its eligible participants from all six conditions in their own evidence condition, with no directional prediction. E4b reuses the H5b model: each included SMA and NCM participant is predicted under both outcomes and both evidence conditions with their other predictors unchanged, and the non-stereotypical SMA – NCM difference is subtracted from the stereotypical one before averaging. 95% CI = participant percentile bootstrap interval from the same attempts as H5a and H5b. Percentile bootstrap: 10000 within-condition participant resamples; usable attempts per quantity: 10000 of 10000 (failed attempts are not replaced).

Figure 2-S7.1

Punishment support slope	−0.44	[−0.56, −0.32]	−7.39	< .001	—	—	—	—
Hostile sexism slope	0.07	[−0.09, 0.22]	0.86	.391	—	—	—	—
Benevolent sexism slope	0.06	[−0.07, 0.19]	0.94	.348	—	—	—	—

Note. b = unstandardized coefficient of each component (glmmTMB; no common intercept, so each condition has its own), with the Wald 95% interval from that component's covariance and its z test; — = not in that version. The Gamma component has one dispersion parameter. These coefficients are descriptive; the registered read is the expected-award difference with its percentile bootstrap interval (H5c: Chapter 5). Gamma dispersion: adjusted 1.112, unadjusted 1.203. Both components converged in every version.

Subjective probability of guilt (H5d)

Table 2-S7.5

Adjusted means of the subjective probability of guilt by condition, adjusted and unadjusted ANCOVAs (primary sample)

	Stereotypical			Non-stereotypical		
Rating and version	**None**	**SMA**	**NCM**	**None**	**SMA**	**NCM**
Subjective probability of guilt (0–100), adjusted: M [95% CI]	40.05 [32.96, 47.14]	48.81 [41.52, 56.09]	41.12 [34.38, 47.87]	37.74 [30.49, 44.99]	36.90 [29.54, 44.27]	32.28 [24.94, 39.61]
Subjective probability of guilt (0–100), unadjusted: M [95% CI]	39.89 [31.86, 47.92]	48.73 [40.55, 56.91]	40.78 [33.17, 48.40]	36.31 [28.13, 44.49]	36.88 [28.54, 45.22]	34.41 [26.15, 42.67]

Note. Each entry is the adjusted mean [95% t interval] from emmeans on the saved ANCOVA (adjusted: at the attitude means; unadjusted: the condition means), with the model's residual df. Each registered comparison is the difference of the equal-evidence averages of these means.

Table 2-S7.6

Omnibus source tables of the H5d ANCOVA, adjusted and unadjusted (primary sample)

Source	F	df1	df2	p	Partial η²	90% CI
Subjective probability of guilt (0–100), adjusted						
Evidence	6.49	1	309	.011	.021	[.005, 1.000]
Outcome information	1.44	2	309	.238	.009	[.000, 1.000]
Abortion attitudes	9.86	1	309	.002	.031	[.011, 1.000]
Punishment support	28.08	1	309	< .001	.083	[.049, 1.000]
Hostile sexism	0.00	1	309	.970	.000	[.000, 1.000]
Benevolent sexism	0.34	1	309	.560	.001	[.000, 1.000]
Evidence × outcome information	0.89	2	309	.411	.006	[.000, 1.000]

Source	F	df1	df2	p	Partial η²	90% CI
Subjective probability of guilt (0–100), unadjusted						
Evidence	4.58	1	313	.033	.014	[.002, 1.000]
Outcome information	0.99	2	313	.373	.006	[.000, 1.000]
Evidence × outcome information	0.51	2	313	.601	.003	[.000, 1.000]

Note. Analysis of covariance (ANCOVA) with abortion attitudes, support for punishment, hostile sexism, and benevolent sexism as covariates. Type-II F-tests have partial eta-squared (partial η^2; η^2_p) and noncentral F 90% CIs. I omit sums of squares and mean squares. Adjusted means come from emmeans at the covariate mean(s). Adjusted = ANCOVA with four attitude covariates; unadjusted = two-way ANOVA without covariates. H5d support depended on the registered comparison, regardless of the omnibus F tests.

Evidence interpretation and the ruling (E4d–E4h)

Table 2-S7.7

Evidence interpretation, foreseeability and the ruling: serial products, foreseeability coefficients and the consistency contrast on the probit scale (E4d–E4h)

		Stereotypical		Non-stereotypical		Across evidence conditions

NCM – None → foreseeability → ruling		11.536	[−4.961, 156.405]	−0.642	[−77.074, 50.812]		

		Stereotypical		Non-stereotypical		Across evidence conditions	
Pathway	**Letter**	**b**	**95% CI**	**b**	**95% CI**	**b**	**95% CI**
Consistent – inconsistent foreseeability contribution	E4h					−6.226	[−145.237, 69.934]

Note. b = unstandardized estimate on the ruling's latent probit scale (WLSMV, theta parameterization). Primary sample, adjusted. Serial products multiplied the SMA or NCM – None difference in a relevance or incrimination factor intercept by its factor-to-likelihood slope and the likelihood-to-ruling slope. These slopes were equal across six conditions; foreseeability slopes differed by outcome but were equal across evidence conditions. Only 882 of 10,000 participant resamples within conditions were usable. Failed attempts were not replaced. I did not interpret 95% percentile intervals based on those fits. Letter identifies the registered read; other rows carry no support gate.

Table 2-S7.8

Global fit of the E4d–E4h model in the four sample and adjustment versions: scaled test statistic and indices as saved by the analysis

Version	**N**	**chi2**	**df**	**p**	**chi2/ df**	**CFI**	**TLI**	**RMSEA**	**RMSEA 90% CI**	**SRMR**
Primary sample										
Adjusted	320	2405.87	2088	< .001	1.15	0.585	0.699	0.054	[0.043, 0.064]	0.176
Unadjusted		Not estimable								
Sensitivity sample										
Adjusted		Not estimable								

Version	N	chi2	df	p	chi2/ df	CFI	TLI	RMSEA	RMSEA 90% CI	SRMR
Unadjusted		Not estimable								

Note. χ^2 = mean- and variance-adjusted (scaled-and-shifted) χ^2 (WLSMV; lavaan test scaled.shifted), with its df and p; CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation (with 90% CI); SRMR = standardized root mean square residual. CFI, TLI and RMSEA (with its 90% CI) are computed from the scaled χ^2 (lavaan's .scaled indices). The RMSEA 90% CI uses lavaan's scaled, rather than robust, RMSEA (fitMeasures(), robust = FALSE). It converts the noncentral χ^2 interval at the scaled statistic's degrees of freedom to the RMSEA scale, including the multiple-group factor $\sqrt{G}$ (G = 6 groups). lavaan estimator WLSMV (DWLS with robust.sem standard errors, theta parameterization); complete responses, as registered (registered analysis supplement). The statistics for legal-indirect primary adjusted come from a fit-statistics-only refit of the registered model with its estimator's default test, evaluated at the registered estimates (largest difference from them: 5.7e-14). The registration specifies no fit cutoffs for this model. N counts eligible participants. The legal-indirect primary unadjusted, sensitivity adjusted, and sensitivity unadjusted versions did not yield converged, admissible solutions under lavaan's convergence and post-estimation checks. They therefore have no reported estimates, as required for original-sample results by the registered analysis supplement.

Note. b is unstandardized, with the ruling equation on its latent probit scale under theta parameterization; β is lavaan std.all, standardized within condition. SE, z, p, and the 95% CI are robust WLSMV Wald statistics on b. Conditions = conditions sharing the registered unstandardized coefficient and its inference.

Pathway	**Letter**	**b**	**95% CI**	**Median**	**95% CrI**	**b**	**95% CI**	**Median**	**95% CrI**
NCM – None → foreseeability → ruling, non-stereotypical		0.035	[−0.112, 0.248]	0.027	[−0.083, 0.204]	−0.002	[−0.124, 0.133]	−0.0004	[−0.124, 0.116]
Consistent – inconsistent foreseeability contribution	E4h	0.041	[−0.058, 0.186]	0.033	[−0.046, 0.171]	0.038	[−0.050, 0.166]	0.031	[−0.048, 0.146]

Note. Unregistered follow-up; no support decisions. Relevance and incrimination (ten-item means) predicted abortion likelihood (0–100); likelihood and foreseeability (four-item mean) predicted probable-cause rulings through a probit model, with foreseeability slopes varying by outcome. b = unstandardized estimate in probit units; 95% CI = participant percentile bootstrap confidence interval (10,000 usable resamples within conditions in each version). Median = posterior median; 95% CrI = equal-tailed credible interval from the joint Bayesian model. Adjusted Bayesian estimates were not interpreted because convergence criteria failed (maximum R-hat = 1.014; criterion ≤ 1.01). Unadjusted estimates met all diagnostic criteria.

Sensitivity to restrictions across stereotypicality conditions

Table 2-S7.11

Structural sensitivity: nested comparison of the three E4d–E4h models across stereotypicality conditions (scaled difference tests)

Model	Constraint	χ^2 (df)	$\Delta\chi^2$ (Δdf)	p
Primary, adjusted				
Model 1	SMA – NCM differences in relevance, incrimination and foreseeability, and five slopes, equal across evidence conditions	1596.82 (1362)	—	—
Model 2	the three SMA – NCM differences free across evidence conditions	1596.33 (1359)	1.72 (3)	.633
Model 3	the five slopes also free across evidence conditions	1592.73 (1354)	5.58 (5)	.349
Primary, unadjusted				
Not estimable (primary, unadjusted)				
Sensitivity, adjusted				
Not estimable (sensitivity, adjusted)				
Sensitivity, unadjusted				
Not estimable (sensitivity, unadjusted)				

Note. χ^2 = WLSMV scaled-shifted chi-square; df = degrees of freedom; $\Delta\chi^2$ = Satorra (2000) scaled difference test against the preceding model. Model 2 freed three SMA – NCM differences across evidence conditions; Model 3 also freed five slopes. Only the primary adjusted models converged and were admissible for comparison. No model was selected; nonsignificant differences did not establish equivalent pathways.

Blame and compensatory awards (E4i–E4j)

Table 2-S7.12

Blame and compensatory awards: the remaining SMA − NCM difference, its evidence difference and the ±½ SD blame probes from the two-part model (E4i, E4j)

Comparison	Letter	Predicted direction	Δ Pr(award)	Δ positive mean ($)	Δ expected award ($)	95% percentile CI	Usable attempts	Decision
Primary, adjusted								
Officer blame, mean + ½ SD − mean − ½ SD	E4i	above zero	.20	−5,338	20,869	[−18,239, 53,123]	9999 of 10000	not supported by all registered criteria
Plaintiff blame, mean + ½ SD − mean − ½ SD	E4j	below zero	−.12	−19,471	−30,845	[−66,296, 1,097]	9998 of 10000	not supported by all registered criteria
SMA − NCM		none registered	.02	−43,490	−32,363	[−87,430, 26,558]	9999 of 10000	reported without a direction
(SMA − NCM, stereotypical) − (SMA − NCM, non-stereotypical)		none registered	.06	35,999	37,400	[−88,877, 145,969]	9999 of 10000	reported without a direction

Comparison	Letter	Predicted direction	Δ Pr(award)	Δ positive mean ($)	Δ expected award ($)	95% percentile CI	Usable attempts	Decision
Primary, unadjusted								
Officer blame, mean + ½ SD – mean – ½ SD	E4i	above zero	.20	−29,006	4,633	[−48,006, 46,408]	9999 of 10000	sensitivity or companion: no decision
Plaintiff blame, mean + ½ SD – mean – ½ SD	E4j	below zero	−.13	−45,958	−55,281	[−114,196, −19,232]	9998 of 10000	sensitivity or companion: no decision
SMA – NCM		none registered	−.001	34,412	26,999	[−62,370, 167,872]	9999 of 10000	sensitivity or companion: no decision
(SMA – NCM, stereotypical) – (SMA – NCM, non-stereotypical)		none registered	.06	−143,343	−97,174	[−403,088, 85,405]	9999 of 10000	sensitivity or companion: no decision
Sensitivity, adjusted								
Officer blame, mean + ½ SD – mean – ½ SD	E4i	above zero	.24	−12,725	25,596	[−29,367, 71,085]	9981 of 10000	sensitivity or companion: no decision
Plaintiff blame, mean + ½ SD – mean – ½ SD	E4j	below zero	−.11	−57,733	−57,033	[−121,963, −17,158]	9775 of 10000	sensitivity or companion: no decision

Comparison	Letter	Predicted direction	Δ Pr(award)	Δ positive mean ($)	Δ expected award ($)	95% percentile CI	Usable attempts	Decision
SMA – NCM		none registered	−.02	−8,980	−8,831	[−90,204, 132,175]	9983 of 10000	sensitivity or companion: no decision
(SMA – NCM, stereotypical) – (SMA – NCM, non-stereotypical)		none registered	.10	−85,930	−46,969	[−341,085, 113,961]	9983 of 10000	sensitivity or companion: no decision
Sensitivity, unadjusted								
Officer blame, mean + ½ SD – mean – ½ SD	E4i	above zero	.24	−47,132	10,754	[−116,819, 94,482]	9981 of 10000	sensitivity or companion: no decision
Plaintiff blame, mean + ½ SD – mean – ½ SD	E4j	below zero	−.13	−128,587	−117,450	[−348,469, −27,817]	9775 of 10000	sensitivity or companion: no decision
SMA – NCM		none registered	−.02	220,538	169,337	[−68,200, 739,915]	9983 of 10000	sensitivity or companion: no decision

Comparison	Letter	Predicted direction	Δ Pr(award)	Δ positive mean ($)	Δ expected award ($)	95% percentile CI	Usable attempts	Decision
(SMA – NCM, stereotypical) – (SMA – NCM, non-stereotypical)		none registered	.09	−576,035	−427,247	[−1,708,472, 72,896]	9983 of 10000	sensitivity or companion: no decision

Note. Expected awards averaged each participant's predicted award probability (logistic model) × predicted positive amount (Gamma model, log link), including zero awards. Blame comparisons used the reference mean ±½ SD, other predictors unchanged, actual evidence conditions, and equal SMA/NCM weights. 95% CI = participant percentile bootstrap interval for expected-award differences (10,000 attempts within conditions; failures not replaced). Component differences were descriptive, without intervals. SMA – NCM and its difference across evidence conditions had no registered direction.

The Probability Threshold for a Yes Ruling (E4k)

Table 2-S7.13

Guilt-Probability Thresholds for a Yes Ruling Under None and NCM Information (E4k)

	Common slope (primary)		Six slopes (sensitivity)	
Quantity	**Estimate**	**Status**	**Estimate**	**Status**
Primary, adjusted				
None crossing	82.72	available	59.86	available
NCM crossing	Not available (no crossing)	unavailable: no crossing	65.31	available
NCM – None	Not available	unavailable: NCM crossing not available	5.45	available
Primary, unadjusted				
None crossing	51.53	available	57.12	available
NCM crossing	67.38	available	55.89	available
NCM – None	15.86	available	−1.22	available
Sensitivity, adjusted				
None crossing	Not available (no crossing)	unavailable: no crossing	43.92	available
NCM crossing	Not available (no crossing)	unavailable: no crossing	67.50	available
NCM – None	Not available	unavailable: None and NCM crossings not available	23.58	available
Sensitivity, unadjusted				
None crossing	46.59	available	60.56	available
NCM crossing	69.83	available	52.66	available

	Common slope (primary)		Six slopes (sensitivity)	
Quantity	**Estimate**	**Status**	**Estimate**	**Status**
NCM – None	23.24	available	−7.90	available

Note. Threshold = guilt-probability rating (0–100) at a single resolved upward crossing of .50 in mean predicted ruling probability. WLSMV probit models (theta parameterization) estimated a common slope or six condition-specific slopes; adjusted models included four common attitude slopes. Both used the same participants and resamples, retaining participants' evidence conditions. In adjusted common-slope models, NCM had no crossing in the primary sample; neither None nor NCM crossed in the sensitivity sample. Corresponding threshold differences were unavailable. 95% percentile bootstrap CIs required valid crossings in all 10,000 attempts; none were available. E4k had no registered decision rule.

Figure 2-S7.4

Average predicted probability of a yes ruling across the subjective probability of guilt, one line per outcome condition, with the E4k crossings at 50%

S8. Attitudes as moderators (RQ5)

Notes shared by tables of this section.

- Tables 2-S8.1 to 2-S8.6: *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).
- Tables 2-S8.1 to 2-S8.5: In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).

Sexism and plaintiff blame (H6a–H6b)

Table 2-S8.1

Sexism model: the registered slope differences with robust normal (Wald) 95% intervals and the conditional differences in the four sample and adjustment versions (H6a–H6b)

	Primary, adjusted		Primary, unadjusted		Sensitivity, adjusted		Sensitivity, unadjusted	
Quantity	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**
Registered slope differences (robust normal 95% CI)								
Hostile sexism, SMA – NCM slope difference (H6a)	−0.38 [−0.82, 0.05]	.086	−0.41 [−0.86, 0.03]	.066	−0.08 [−0.63, 0.47]	.781	−0.20 [−0.79, 0.39]	.505
Benevolent sexism, SMA – NCM slope difference (H6b)	0.13 [−0.38, 0.65]	.614	0.05 [−0.46, 0.55]	.857	0.05 [−0.53, 0.62]	.871	0.05 [−0.51, 0.61]	.866

Quantity	Primary, adjusted		Primary, unadjusted		Sensitivity, adjusted		Sensitivity, unadjusted	
	Estimate [95% CI]	**p**	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**	**Estimate [95% CI]**	**p**
Conditional SMA – NCM differences in blame at the probes (descriptive; probed score in parentheses)								
Hostile sexism, one SD below the mean	1.75 (at 0.12)		1.81 (at 0.12)		unavailable		unavailable	
Hostile sexism, one SD above the mean	0.74 (at 2.77)		0.71 (at 2.77)		unavailable		unavailable	
Benevolent sexism, one SD below the mean	1.11 (at 1.02)		1.23 (at 1.02)		2.03 (at 0.93)		2.05 (at 0.93)	
Benevolent sexism, one SD above the mean	1.43 (at 3.39)		1.34 (at 3.39)		2.15 (at 3.42)		2.17 (at 3.42)	

Note. Registered decisions used the primary adjusted model. SMA – NCM blame differences were evaluated at each sexism scale's fitted mean ±1 SD for that model version, weighting evidence conditions by the numbers of included participants. These probes were descriptive, without tests.

Table 2-S8.2

Plaintiff-Blame Estimates by Condition and Model Version

Parameter: b [95% CI]	Stereotypical			Non-stereotypical		
	None	**SMA**	**NCM**	**None**	**SMA**	**NCM**

Sensitivity, unadjusted						
Intercept	3.14 [2.06, 4.22]	4.68 [3.17, 6.20]	2.22 [1.34, 3.10]	2.01 [1.08, 2.94]	4.08 [2.37, 5.80]	2.05 [1.13, 2.97]
Hostile sexism	0.47 [−0.03, 0.97]	0.26 [−0.41, 0.93]	0.79 [0.47, 1.11]	1.07 [0.81, 1.33]	0.69 [−0.14, 1.52]	0.53 [0.14, 0.92]
Benevolent sexism	0.15 [−0.24, 0.55]	−0.03 [−0.77, 0.70]	−0.13 [−0.49, 0.23]	−0.02 [−0.41, 0.36]	−0.02 [−0.63, 0.59]	−0.01 [−0.45, 0.42]
Residual variance	2.97 [2.00, 3.94]	4.47 [3.11, 5.84]	2.47 [1.62, 3.33]	2.21 [1.29, 3.13]	4.05 [2.07, 6.03]	2.49 [1.57, 3.41]

Note. Hostile- and benevolent-sexism slopes, intercepts, and residual variances were free to vary by condition. Other slopes marked (common) were shared across all six conditions in adjusted models only; b = unstandardized estimate; 95% CI = robust Wald confidence interval.

Table 2-S8.3

Benevolent sexism and the SMA – NCM difference in plaintiff blame within each evidence condition and their difference, robust normal (Wald) 95% intervals, in the four sample and adjustment versions (E5c)

	Stereotypical evidence	Non-stereotypical evidence	Non-stereotypical – stereotypical (E5c)		
Sample and version	**b [95% CI]**	**b [95% CI]**	**b [95% CI]**	**z**	**p**
Primary, adjusted	0.36 [−0.28, 0.99]	−0.11 [−0.93, 0.71]	−0.47 [−1.51, 0.57]	−0.88	.379
Primary, unadjusted	0.24 [−0.42, 0.90]	−0.17 [−0.93, 0.59]	−0.41 [−1.42, 0.60]	−0.79	.427
Sensitivity, adjusted	0.10 [−0.72, 0.91]	−0.004 [−0.81, 0.80]	−0.10 [−1.25, 1.05]	−0.17	.864
Sensitivity, unadjusted	0.10 [−0.72, 0.92]	−0.005 [−0.76, 0.75]	−0.10 [−1.21, 1.01]	−0.18	.858

Note. Within each evidence condition: the SMA coefficient minus the NCM coefficient of benevolent sexism in the plaintiff-blame equation of the sexism model (the H6a–H6b fit). E5c: the non-stereotypical difference minus the stereotypical difference; a positive value means stronger moderation under non-stereotypical evidence, the registered direction. All three with robust normal (Wald) 95% intervals from the full robust (MLR) covariance; the two parts are reported beside the registered difference and carry no rule. Decision for E5c (primary adjusted): not supported by all registered criteria.

Abortion attitudes and officer decision quality (E5a)

Table 2-S8.4

Abortion attitudes and the SMA – NCM difference in decision quality: the registered slope difference with its robust normal (Wald) 95% interval and the conditional differences one SD below and above the mean, in the four sample and adjustment versions (E5a)

	SMA – NCM slope difference				One SD below the mean		One SD above the mean	
Sample and version	**b [95% CI]**	**SE**	**z**	**p**	**Score**	**SMA – NCM**	**Score**	**SMA – NCM**
Primary, adjusted	0.02 [−0.22, 0.26]	0.12	0.17	.867	1.48	0.29	4.94	0.36
Primary, unadjusted	−0.01 [−0.26, 0.24]	0.13	−0.08	.935	1.48	0.19	4.94	0.16
Sensitivity, adjusted	0.15 [−0.14, 0.43]	0.14	1.01	.311	1.26	0.40	4.82	0.91
Sensitivity, unadjusted	0.15 [−0.13, 0.43]	0.14	1.02	.306	1.26	0.30	4.82	0.82

Note. b = the SMA coefficient minus the NCM coefficient of abortion attitudes in the decision-quality equation, in points of the decision-quality mean (1–7) per point of abortion attitudes (1–7; higher scores are more restrictive), averaged over the two evidence conditions weighted as represented among included participants (primary adjusted: stereotypical 0.522, non-stereotypical 0.478); a positive value means a larger SMA – NCM difference among participants with more restrictive views. The abortion-attitude slope and the residual variance are free in each condition; the other three attitudes carry common slopes (adjusted versions). SE, z, p and the 95% CI: robust normal (Wald) statistics from the full robust (MLR, Huber-White) covariance, as registered. The registered read is the primary adjusted row; the other rows are reported without decisions. Conditional differences: the predicted SMA – NCM difference in decision quality at one SD below and above each version's fitted abortion-attitude mean (Score = the probed value), the other attitudes at each evidence condition's fitted means; illustrations without tests. Primary adjusted probes: abortion attitudes: fitted mean 3.21, SD 1.73, probes 1.48 and 4.94, observed range common to all six conditions 1.00 to 6.71. lavaan estimator MLR (estimator ML with robust.huber.white standard errors, missing = ml). No model variable was missing, so no auxiliary items were used. Decision for E5a (primary adjusted): not supported by all registered criteria.

Abortion attitudes and hindsight (E5d–E5e)

Table 2-S8.5

Abortion attitudes and the outcome effects on foreseeability and abortion likelihood: SMA – None and NCM – None slope differences with robust normal (Wald) 95% intervals, and the conditional SMA – None differences one SD below and above the mean, in the four sample and adjustment versions (E5d–E5e)

	SMA – None slope difference			NCM – None slope difference		One SD below the mean		One SD above the mean	
Sample and version	**b [95% CI]**	**z**	**p**	**b [95% CI]**	**p**	**Score**	**SMA – None**	**Score**	**SMA – None**
Foreseeability, 1–5 (E5d)

Sensitivity, unadjusted	−0.10 [−0.26, 0.06]	−1.24	.214	−0.17 [−0.34, −0.01]	.039	1.26	0.10	4.82	−0.27
Abortion likelihood, 0–100 (E5e)									
Primary, adjusted	−9.90 [−14.76, −5.05]	−4.00	< .001	−2.35 [−6.81, 2.11]	.302	1.48	30.97	4.94	−3.37
Primary, unadjusted	−10.66 [−15.50, −5.82]	−4.32	< .001	−2.87 [−7.33, 1.60]	.208	1.48	31.34	4.94	−5.62
Sensitivity, adjusted	−13.46 [−18.92, −8.00]	−4.83	< .001	−1.47 [−6.60, 3.66]	.575	1.26	44.91	4.82	−2.95

	SMA – None slope difference			NCM – None slope difference		One SD below the mean		One SD above the mean	
Sample and version	**b [95% CI]**	**z**	**p**	**b [95% CI]**	**p**	**Score**	**SMA – None**	**Score**	**SMA – None**
Sensitivity, unadjusted	−13.72 [−19.19, −8.26]	−4.92	< .001	−1.83 [−6.97, 3.32]	.486	1.26	44.81	4.82	−3.98

Note. Two single-outcome models in the E5a form, one per judgment. SMA – None: the SMA coefficient minus the no-information coefficient of abortion attitudes (higher scores are more restrictive), averaged over the two evidence conditions weighted as represented among included participants (primary adjusted, foreseeability: stereotypical 0.522, non-stereotypical 0.478; abortion likelihood: stereotypical 0.522, non-stereotypical 0.478); a positive value means a more positive SMA effect among participants with more restrictive views (the registered read of E5d and E5e). NCM – None: the same for NCM information, reported without a direction, as registered. z, p and the 95% CI: robust normal (Wald) statistics from the full robust (MLR, Huber-White) covariance, as registered. The registered read is the primary adjusted row of each band. Conditional differences: the predicted SMA – None difference in the judgment at one SD below and above each version's fitted abortion-attitude mean (Score = the probed value), the other attitudes at each evidence condition's fitted means; illustrations without tests. Primary adjusted probes, foreseeability model: abortion attitudes: fitted mean 3.21, SD 1.73, probes 1.48 and 4.94, observed range common to all six conditions 1.00 to 6.71; abortion-likelihood model: abortion attitudes: fitted mean 3.21, SD 1.73, probes 1.48 and 4.94, observed range common to all six conditions 1.00 to 6.71. lavaan estimator MLR (estimator ML with robust.huber.white standard errors, missing = ml) (both models). Foreseeability model and abortion-likelihood model: no model variable was missing, so no auxiliary items were used. Neither E5d nor E5e met all registered criteria in the primary adjusted analysis. E5e also depends on the stereotypicality rule; that rule's verdict was "manipulated."

Abortion attitudes and compensatory damages (E5b)

Table 2-S8.6

Abortion attitudes and the SMA – NCM difference in compensatory awards: two-part model probes one SD below and above the mean with participant percentile bootstrap 95% intervals (E5b)

Probe	Comparison	Delta Pr(award)	Delta positive mean	Delta expected award	95% CI
One SD below the mean (1.53)	SMA – NCM	.02	−29,795	−23,380	[−90,692, 30,439]
One SD above the mean (5.08)	SMA – NCM	.02	−13,994	−2,064	[−169,894, 430,577]

Probe	Comparison	Delta Pr(award)	Delta positive mean	Delta expected award	95% CI
Above minus below	Difference of the two SMA – NCM differences	–.01	15,801	21,316	[–166,524, 459,710]

Note. I examined whether the SMA – NCM award difference varied with abortion attitudes using a logistic model for any award and a Gamma model with a log link for positive amounts. In this primary adjusted two-part model, each part has six condition intercepts and six abortion-attitude slopes. Within each part, the plaintiff-blame, officer-blame, and other three attitude slopes are common across the six conditions. The Gamma model has one dispersion parameter. For each attitude probe, I calculated the SMA – NCM differences in award probability, positive award amount, and expected award. Expected award is the product of probability and positive amount, including zero awards. Predictions cover the included SMA and NCM participants (n = 213), each in their own evidence condition with equal weight, with attitudes set to the probe. Probe values are the participants' abortion-attitude mean (3.31) minus and plus one sample SD (1.77). Both lie inside the observed range common to all four SMA and NCM conditions, 1.00 to 6.86. As specified in the registered analysis supplement, the last row subtracts the lower-score difference from the higher-score difference. The 95% interval covers only the expected-award difference. Each participant percentile bootstrap attempt refits both model parts and recalculates its attitude mean and SD. Of 10000 participant resamples drawn within conditions, 9959 were usable per quantity; failed attempts were not replaced. Award-probability and positive-award differences are descriptive components of the same predictions, without intervals. E5b has no registered direction or support gate. Decision for E5b: estimates reported; no registered decision rule.

S9. The sensitivity sample

Notes shared by tables of this section.

- Tables 2-S9.1 to 2-S9.5: *N* = 320 (Stereotypical, None, *n* = 55; Stereotypical, SMA, *n* = 52; Stereotypical, NCM, *n* = 60; Non-stereotypical, None, *n* = 52; Non-stereotypical, SMA, *n* = 50; Non-stereotypical, NCM, *n* = 51).
- Tables 2-S9.1 to 2-S9.5: In the sensitivity analysis, *N* = 212 (Stereotypical, None, *n* = 32; Stereotypical, SMA, *n* = 33; Stereotypical, NCM, *n* = 45; Non-stereotypical, None, *n* = 36; Non-stereotypical, SMA, *n* = 29; Non-stereotypical, NCM, *n* = 37).
- Tables 2-S9.2 and 2-S9.3: Not estimable (legal-indirect, primary sample, unadjusted; legal-indirect, sensitivity sample, adjusted; legal-indirect, sensitivity sample, unadjusted): in this sample and version the model did not reach a converged, admissible solution (lavaan's convergence and post-estimation checks), so no estimates are reported.
- Tables 2-S9.2 and 2-S9.3: The registration requires an admissible, converged solution for an original-sample result (registered analysis supplement).

Participants in each sample

Table 2-S9.1

Participants in each condition of the primary and sensitivity samples, and the registered exclusions between them

Sample or rule	Stereotypical			Non-stereotypical			All conditions
	None	**SMA**	**NCM**	**None**	**SMA**	**NCM**	
Samples							
Primary sample	55	52	60	52	50	51	320
Sensitivity sample	32	33	45	36	29	37	212
Not retained	23	19	15	16	21	14	108
Not retained, by registered sensitivity rule							
Outcome check wrong or blank	12	9	8	10	15	11	65
Stereotypicality check wrong or blank	2	1	1	3	0	0	7

Sample or rule	Stereotypical			Non-stereotypical			All conditions
	None	SMA	NCM	None	SMA	NCM	
Content-recognition check wrong or blank	13	10	7	6	7	5	48
Under one-third of the median completion time	0	0	1	0	0	0	1

Note. Entries are numbers of participants (n). Counts from the analysis sample. They equal the eligibility counts and sample flow of the data preparation. Not retained = primary minus sensitivity. A participant flagged by more than one rule is counted under each, so the rule rows can add up to more than the participants not retained. No interval is estimated in this table (the percentile bootstrap, Student t and Wald intervals of the estimates are in the tables below).

Status of every model in each sample

Table 2-S9.2

Every registered model in each sample and version of the saved run: whether it could be estimated, and the participants it used

Model and letters	Primary sample		Sensitivity sample	
	Adjusted, N	Unadjusted, N	Adjusted, N	Unadjusted, N
RQ1: hindsight				
H1a (H1a, H1b, H1c)	320	320	212	212

RQ4: legal decisions				
basic-probable-cause (H5a, E4a)	320	320	212	212
remaining-probable-cause (H5b, E4b)	320	320	212	212
H5c (H5c)	320	320	212	212
basic-offense-probability (H5d)	319	319	211	211
joint-judgments-probable-cause (E4c)	320	320	212	212
legal-indirect (E4d, E4e, E4f, E4g, E4h)	320	Not estimable	Not estimable	Not estimable
explanatory-compensatory (E4i, E4j)	320	320	212	212
threshold-comparison (E4k)	319	319	211	211
structural-sensitivity (no letter)	213	Not estimable	Not estimable	Not estimable
RQ5: attitudes as moderators				
sexism-blame (H6a, H6b, E5c)	320	320	212	212
quality-moderation (E5a)	320	320	212	212
hindsight-attitudes (E5d, E5e)	320	320	212	212

Model and letters	Primary sample		Sensitivity sample	
	Adjusted, N	**Unadjusted, N**	**Adjusted, N**	**Unadjusted, N**
award-moderation (E5b)	320	320	212	212

Note. N = the participants the model used in that sample and version (full information maximum likelihood models use every participant; the others use the participants with every rating the model needs). Not estimable (structural-sensitivity, primary sample, unadjusted; structural-sensitivity, sensitivity sample, adjusted; structural-sensitivity, sensitivity sample, unadjusted): the equal model of the registered nested comparison did not reach a converged, admissible solution, so the comparison cannot be computed in this sample and version. No interval is estimated in this table (the percentile bootstrap, Student t and Wald intervals of the estimates are in the tables below).

Bootstrap attempts

Table 2-S9.3

Attempted and usable percentile-bootstrap resamples of every bootstrap analysis in each sample and version

Record	Primary sample			Sensitivity sample		
	Attempted	**Usable**	**Minimum**	**Attempted**	**Usable**	**Minimum**

RQ5: attitudes as moderators						
award-moderation (E5b): adjusted	10,000	9,959	met	10,000	9,440	met

	Primary sample			Sensitivity sample		
Record	**Attempted**	**Usable**	**Minimum**	**Attempted**	**Usable**	**Minimum**
award-moderation (E5b): unadjusted	10,000	9,960	met	10,000	9,435	met

Note. Attempted counts participant resamples drawn with replacement within each of the six conditions of that sample. Usable = resamples with finite target estimates; ranges reflect variation across targets. Minimum = intervals available for every target (at least two finite resamples; all attempts for thresholds). Failed attempts were not replaced. ANCOVA, profile, and moderation models used t or Wald intervals, without bootstrapping.

Primary and Sensitivity Samples

Table 2-S9.4

Registered Targets and Decisions Across Samples: Adjusted Models

	Primary sample			Sensitivity sample			
Letter and target	**Estimate**	**CI**	**Decision**	**Estimate**	**CI**	**Decision**	**Interval**
RQ1: hindsight							
H1a: Abortion likelihood: Non-stereotypical evidence: SMA – None	11.69	[−0.10, 23.49]	not supported	24.59	[9.55, 39.63]	supported	95% Student t
H1d: Miscarriage likelihood: Stereotypical evidence: SMA – None	−12.02	[−22.71, −1.34]	supported	−9.45	[−23.05, 4.15]	not supported	95% Student t
H1f: Miscarriage likelihood: Stereotypical evidence: NCM – None	5.96	[−4.33, 16.25]	not supported	14.01	[1.36, 26.66]	supported	95% Student t

	Primary sample			Sensitivity sample			
Letter and target	**Estimate**	**CI**	**Decision**	**Estimate**	**CI**	**Decision**	**Interval**
RQ2: moral judgments of the plaintiff							
H3c: Plaintiff blame (1–7): SMA – NCM → likelihood → negligence → plaintiff blame	0.14	[0.04, 0.31]	supported	0.18	[−0.04, 0.49]	not supported	95% percentile bootstrap
H3e: Deserved punishment: SMA versus NCM	0.30	[−0.13, 0.72]	not supported	0.76	[0.25, 1.28]	supported	95% Student t
E2b: Plaintiff blame (1–7): Through negligence (serial plus shorter) → plaintiff blame	0.40	[0.12, 0.77]	supported	0.55	[−0.12, 1.27]	not supported	95% percentile bootstrap
RQ3: evaluations of the officer							
H4a: Decision quality (1–7): SMA – None	0.33	[−0.10, 0.76]	not supported	0.63	[0.07, 1.19]	supported	95% Student t
H4e: Deserved consequences (0–10): SMA – None	−0.69	[−1.47, 0.09]	not supported	−1.30	[−2.34, −0.25]	supported	95% Student t
RQ4: legal decisions							

	Primary sample			Sensitivity sample			
Letter and target	**Estimate**	**CI**	**Decision**	**Estimate**	**CI**	**Decision**	**Interval**
E4j: Plaintiff blame, mean + ½ SD − mean − ½ SD	−30845.39	[−66295.56, 1096.58]	not supported	−57033.03	[−121963.46, −17157.72]	supported	95% percentile bootstrap

Note. Models included four attitude covariates; CI levels and methods appear in the Interval column. Sensitivity-sample percentile intervals used 10,000 participant resamples within conditions. Decisions differed on 9 of 149 letter-and-target rows; only those rows are shown. No test compared samples.

Table 2-S9.5

Registered Targets and Decisions Across Samples: Models Without Attitudes

	Primary sample			Sensitivity sample			
Letter and target	**Estimate**	**CI**	**Decision**	**Estimate**	**CI**	**Decision**	**Interval**
RQ1: hindsight							
H1d: Miscarriage likelihood: Stereotypical evidence: SMA – None	−11.59	[−22.88, −0.29]	supported	−12.20	[−26.45, 2.06]	not supported	95% Student t
RQ2: moral judgments of the plaintiff							
H3e: Deserved punishment: SMA versus NCM	0.24	[−0.27, 0.76]	not supported	0.75	[0.12, 1.39]	supported	95% Student t
RQ3: evaluations of the officer							
H4a: Decision quality (1–7): SMA – None	0.41	[−0.10, 0.92]	not supported	0.83	[0.17, 1.50]	supported	95% Student t
H4e: Deserved consequences (0–10): SMA – None	−0.85	[−1.71, 0.01]	not supported	−1.61	[−2.75, −0.46]	supported	95% Student t
H4g: Arrest wrongness (0–10): SMA – None	−0.55	[−1.48, 0.38]	not supported	−1.40	[−2.64, −0.15]	supported	95% Student t

Note. Models omitted attitude covariates; CI levels and methods appear in the Interval column. Decisions differed on 5 of 149 letter-and-target rows; only those rows are shown. No test compared samples.

Deviations Records

Pilot Study 1 Deviations Record
Pilot Study 2 Deviations Record
Study 1 Deviations Record
Study 2 Deviations Record

About this document

This part includes the deviations record of each study: Pilot Study 1, Pilot Study 2, Study 1 and Study 2. The deviations records are included in this supplement (https://doi.org/10.5281/zenodo.23424192). The registrations are on the Open Science Framework.

Pilot Study 1 Deviations Record

These entries compare the completed Pilot Study 01 analyses with the registration form, task description, and study measures posted on the project's Open Science Framework page. The Pilot 01 manuscript reports the analyses as conducted; this record supplies the separate account of departures in the supplement (https://doi.org/10.5281/zenodo.23424192).

2. Random-effects structure for the RH7 models

Each participant judged the same 20 card-sorting scenarios. After finalizing the scenarios, and before the confirmatory analysis, I added a scenario random intercept to both RH7 logistic models. Both models also included a participant random intercept. Neither registration entry called for a scenario intercept: RH7.1 named a participant intercept, and RH7.2 gave no random-effects formula. For RH5.1, by contrast, I entered each feature separately as a fixed predictor, with only a participant random intercept.

3. Direction of the Modified Abortion Attitudes Scale

Higher sums on the Modified Abortion Attitudes Scale (Sloan, 1983) indicate stronger pro-abortion attitudes after reverse-keying items 1, 3, 4, 7, 9, 12, and 14. The RH4.1 and RH4.2 labels reverse this scoring direction: a score one standard deviation above the mean is described as "more restrictive." It is more permissive; one standard deviation below the mean is more restrictive. Cleaning and analyses used this scoring direction: negative RH4.1/RH4.2 coefficients and an RH7.1 odds ratio below 1 represented the predicted harsher or more criminalizing judgments with more restrictive attitudes. RH7.2 predicted a stronger association for normative than descriptive judgments. Correcting the labels changed neither the measure nor these four tests.

4. Overlap between the two narrative coders

Coder 1 rated 188 and coder 2 rated 199 narratives, covering all 324 with 63 overlapping. Reliability for the 14 holistic Phase 3 variables used this overlap after excluding unusable narratives and missing codes.

Instead of two ratings per narrative as the coding plan required, I assigned packets of 198 and 199 to reduce the workload. Both included 73 shared narratives: 10 practice and 63 training (about 20% of 314 non-practice narratives). Seeded allocation split the remaining 251 narratives into sets of 125 and 126. I retained agreed or single-coder codes and set

disagreements to missing. After exclusions, 279 narratives had usable mental-state codes for RH2.2 and RH3.1.

Coder time constraints prevented the registered retraining and another pilot coding pass. I reported reliability in full and treated results relying on low-reliability codes as exploratory. Codebook refinement was carried forward to subsequent studies.

5. Specification of the RH5.1 scenario-feature model

Following the working plan, I fitted mental state, medical intervention, pregnancy outcome, care-seeking, and abortion-pill use separately: `is_crime ~ feature + (1 | participant_id)`. RH5.1 named six features without specifying joint or separate entry. In the five-feature joint specification, sought care coincided with medical intervention and delayed care with negligence. Both care-seeking coefficients were absent from the output; it did not establish that all requested effects were estimated or diagnostic criteria were met.

For the single-feature fits, I replaced the 13-level method variable, which had several levels containing one scenario and complete separation, with an abortion-pill indicator for scenarios 1, 2, 4, and 10. I excluded gestational age because 16 of the 20 scenarios did not specify it. The post hoc models predicted judgments from new participants on the same scenarios; they did not separate independent or causal cue effects. I continued to select main-study scenarios for broad disagreement.

6. Change of reference source for the real-world-case half of Exploratory 3

Herold and Sisson (2019) supplied a comparison for depicted methods, but no distribution of plotlines referring to actual cases. I mapped the 36 visually depicted procedures (24 surgical, 7 medication, and 5 other) onto the four Section F (`methodtype`) categories. For the Section J (`realcase`) comparison, I used Pregnancy Justice (2023, *The Rise of Pregnancy Criminalization*), which documented 1,396 U.S. pregnancy-criminalization cases in 2006–2022, with charge information for 97.8%. Among cases with known charges, approximately 84% involved criminal child neglect, abuse, or endangerment; 6% feticide, murder, or manslaughter; 2% tampering with remains or abuse of a corpse; and 1% legally unauthorized abortion. More than 90% of all census cases involved substance-use allegations. Because the prompts balanced crime categories, narrative shares could not estimate participants' beliefs about crime frequencies. I used Pregnancy Justice (2026, *After Pregnancy Loss*) for loss-related examples

and framing in this descriptive comparison. The reference change left `realcase` and RH1–RH7 unchanged.

7. Scope of the RH1 chi-square variable family

I applied the registered Benjamini–Hochberg adjustment to 67 tests of automated variables (43 Phase 1 and 24 Phase 2) instead of the planned 81. Associations involving the 14 holistic Phase 3 codes were exploratory: only one code provided interpretable evidence of adequate reliability, and I had not completed the required refinement and recoding. The parallel verdict-condition tests were descriptive and used the same 67 variables.

8. Feature screening in the RH1 prototype analysis

For clustering only, I added an unregistered screen to the 67 automated codes. I removed `defagecat` (identical to `defagespec` under presence coding) and `nchars` (nearly identical to `namedchars`). Adapting Wiener et al.'s (2002, pp. 129–130) story-index screen, I retained features present in more than one-third and no more than two-thirds of each crime category's narratives. This left 9 features for self-managed abortion, 7 for fetal homicide, and 9 each for chemical endangerment and improper disposal.

9. Selection of the number of clusters in the RH1 prototype analysis

The archived OSF response required at least two crime categories to satisfy "silhouette width > 0.25 or gap-statistic support for k > 2". The response did not specify how to choose k; I selected the two-, three-, or four-cluster solution with the largest average silhouette width in each crime category. Silhouette is undefined for one cluster (Tibshirani et al., 2001, p. 418). Silhouette and the gap statistic selected two clusters in each category; silhouette widths were .285 for self-managed abortion, .384 for fetal homicide, .256 for chemical endangerment, and .241 for improper disposal.

Only improper disposal failed the archived rule: its silhouette was below the cutoff and its gap result did not satisfy k > 2. The local registration, working plan, and analysis used k ≥ 2, counting all four categories rather than three; both readings met the minimum of two.

11. Reliability statistics for ordered holistic codes

Five nominally categorical codes had ordered values: Model Penal Code mental state, socioeconomic status, pregnancy wantedness, partner role, and healthcare-provider role. The

registration says “the target thresholds are Cohen’s kappa for categorical codes and intraclass correlation for dimensional ratings” and “If thresholds are not met, the codebook will be refined and coders will be retrained.” I reported ICCs as well as kappa for these five codes and removed the not-specified category, whose agreement had counted absence of a construct toward reliability.

None provided interpretable evidence of meeting its target. Both coders specified socioeconomic status in only six narratives, partner role in nine, and healthcare-provider role in ten. Their coefficients are included for completeness; such sparse bases establish neither reliability nor unreliability.

15. Reinstated submission

I preregistered a stopping rule of 80 completions. One submission that Prolific’s bot and LLM authenticity check had initially flagged was found to have been flagged in error and was reinstated, so the analytic sample was 81 rather than the registered 80. The five other Prolific exclusions remained, and the registered attention-check criterion excluded no participant.

Pilot Study 2 Deviations Record

1. Power-script coding

I corrected `pilot02_power_scripts.R` to effects-code outcome and dummy-code timing and vignette, with non-criminal miscarriage as the reference vignette. I reported the existing power estimates without rerunning the simulations.

4. Analysis models

4.2 Search-target random effects

Because each participant rated the three targets only once, during the first vignette, I omitted the registered target slopes but retained the participant random intercept for RH7.1, RH7.2, E7.5, and E7.7.

4.3 Complete-case covariate models

For E4.1–E4.3, I required scores on all six covariates: abortion attitudes, punishment attitudes, hostile sexism, benevolent sexism, religiosity, and political ideology. Multi-item scores required at least 80% item completion.

The registration instead states: “For variables with fewer than 5% missing values, we will impute the missing values using multiple imputation by chained equations (Buuren & Groothuis-Oudshoorn, 2011) and analyze the completed data. If a variable has more than 5% missing values, we will report the extent of missing data and analyze only cases with complete data on that variable.” I used complete cases even below 5% missingness, as specified before collection.

4.4 Exploratory intervals

I reported posterior 95% HDIs for officer-model serial mediation, four-mediator parallel mediation of blame, and parallel trait mediation of endorsed punishment, as specified for these Bayesian multilevel models. Only the four-stage chain matched the preamble’s bootstrap description; I used a bias-corrected interval on the product of participant-level regression coefficients (5,000 resamples).

4.6 Priors

I used proper normal(0, s) coefficient priors in each response's units and LKJ(2) random-effect correlation priors. The brms power calls used flat coefficient priors, as the supplement described, so their power figures were approximate for these fits. I did not establish whether they were conservative. I retained default weakly informative priors for the blavaan factor model.

4.7 Reading the convergence gate

Simulation fits continued to sample one participant intercept–post-search-slope correlation inefficiently after twelvefold chain extensions. I therefore applied the convergence criteria to the registered estimands within each imputation: R-hat < 1.01, effective sample sizes > 400, and zero divergences (Vehtari et al., 2021). RH1.2 was supported only under this narrower reading of the registered "all parameters" requirement.

4.8 Joint likelihood and decision-quality responses

I combined likelihood (RH1.1/RH2.1) and decision quality (RH4.1/RH4.2) in one pre-post model, following my reading of the filed answers rather than the unposted registry's separate models. I estimated a residual correlation with its default prior, keeping E4.1′s directed analysis separate. Requiring complete data on both responses could change the sample and estimates; registered contrasts and support rules were unchanged.

6. Authenticity screening and admission

Participant submissions on Prolific were not screened until after payment; as a result, some paid submissions were later excluded from analysis.

7. Convergence remedies before the likelihood correction

Because some initial models failed the convergence criteria, I reran serial models with more iterations and withheld support for hypotheses based on other unrefitted models.

7.8 Participant-Mean Likelihood Equations and Model Convergence

I included each participant's mean likelihood rating once in its mediator equation, as specified in the registered model. For H5a, the first mediator equation included 309 participant means, and the negligence and blame equations each included 927 scenario ratings.

I fit the models with four chains per data set, using five imputed data sets except for the analysis without exclusions, which used complete cases. I increased the number of iterations

as needed for convergence without changing the priors. All nine models met the registered convergence criteria: $\hat{R}$ < 1.01, bulk and tail effective sample sizes > 400, and no divergent transitions.

Sampler Settings and Convergence Diagnostics

Model	Iterations (Warmup) per Chain	Maximum $\hat{R}$	Minimum Bulk ESS	Minimum Tail ESS	Divergences
Primary serial model of blame (H5a)	32,000 (8,000)	1.003	1,146	2,378	0
Matched-item model of blame	32,000 (8,000)	1.004	1,225	2,309	0
Model without exclusions	16,000 (4,000)	1.002	925	1,643	0
Narrower-prior model	16,000 (4,000)	1.006	732	1,455	0
Wider-prior model	16,000 (4,000)	1.008	615	1,279	0
Scenario-order-adjusted model	16,000 (4,000)	1.006	516	1,068	0
Parallel-then-serial model (E5.1)	16,000 (4,000)	1.006	674	1,109	0
Four-mediator model (E5.2)	4,000 (1,000)	1.002	4,456	6,777	0
Officer serial model (E6.4)	32,000 (8,000)	1.004	946	1,904	0

Note. $\hat{R}$ is the maximum and ESS the minimum across parameters and completed data sets; divergences are summed across chains and data sets. ESS = effective sample size. The slider-mediator and uncorrelated-intercept alternatives did not determine support for H5a.

The primary model did not support the predicted H5a serial indirect effect (b = 0.213, 95% HDI [−0.043, 0.496]), nor did the scenario-matched model (b = 0.210, 95% HDI [−0.033, 0.491]). In the exploratory four-mediator model (E5.2), the indirect effects through likelihood and negligence did not credibly differ (likelihood minus negligence = −0.268, 95% HDI [−0.567, 0.022]). The exploratory detective model (E6.4) also did not yield a credible serial indirect effect (b = −0.383, 95% HDI [−0.8530, 0.0003]).

9.1 RH1.4: comparing the same relevance items

The registered consistency coefficient mixed item and outcome differences. HACE included consistent and inconsistent items; all HUCE items were inconsistent. In the criminal-miscarriage and self-managed-abortion vignettes, the HACE-inconsistent set contained only background items 3 and 10. A larger decline under HUCE could therefore contribute to the intended relative-relevance effect.

After seeing this pattern, I applied the HACE key to both outcomes and fitted:

```
relevance_item ~ timing * outcome * key_consistent + vignette + timing:vignette + (1
+ timing | participant_id) + (1 | vignette:item)
```

The three-way interaction compares HACE − HUCE change for key-consistent versus key-inconsistent items. Across equally weighted vignettes, the estimated pre-to-post change for key-consistent items was −0.01 (95% HDI [−0.19, 0.17]) after HACE and −1.20 [−1.38, −1.02] after HUCE. For key-inconsistent items, relevance changed by −0.11 [−0.31, 0.10] after HACE and −0.52 [−0.72, −0.32] after HUCE. Thus, the HUCE decline was larger for items that would have fitted the pregnancy outcome.

I reported RH1.4 as supported using the same-item model (three-way interaction = 0.77, 95% HDI [0.52, 1.02]). The original timing × item-consistency estimate also met the registered rule (0.47, 95% HDI [0.31, 0.64]). I chose the revised model after inspecting the raw means, reducing test severity (Lakens, 2024).

Study 1 Deviations Record

The comparison is with Open Science Framework registration 93w7p, its form, materials, exploratory supplement, and power-analysis script.

Evaluation of the Study 1 and Study 2 departures

I use Lakens (2024) to distinguish severity from validity. Each entry identifies what I could choose and what I had seen when choosing it. Those conditions bear on severity—the ability to support a true hypothesis and withhold support from a false one—separately from validity. Improving validity can leave severity higher, lower, or unchanged. Reasons may overlap: unforeseen events, mistakes in the preregistration or study, missing information, violated untested assumptions, and falsified auxiliary hypotheses. I assess severity for every entry and validity for mistakes and the last two categories. Selecting a rule because it excludes zero introduces selection bias under either inferential framework.

2. Missing guilt measure and the H3c–H3e substitute

H3c–H3e predict a route from outcome information to blame "through how likely participants think it is that the suspect committed the offense": positive after SMA evidence and negative after financial-crime evidence versus no outcome information, and more positive after SMA than financial-crime evidence. The intended mediator was "Based on the evidence available at the time the warrant was sought, what is the probability that the suspect committed the crime the detective suspects her of committing?" on a 0–100 scale (supplement, "Probability and blame (H3c–H3e)", Figure 4).

A survey error kept participants from seeing the guilt item, so I could not run the registered H3c–H3e test or assess its severity. After data collection ended, and before I had analyzed any Study 1 outcome or looked at any likelihood or blame rating, I chose pregnancy-evidence likelihood as the substitute. This registered 0–100 composite combined the abortion and disposal likelihood ratings and was also a mediator in E9a–E9b. It concerned the likelihood that the search would find pregnancy-related evidence, not the suspect's guilt. I did not use the foreseeability index, which concerned how predictable the search outcome was from the detective's perspective; the registration made no directional prediction through it (E9).

I fitted the registered mediation model in two legal-context groups, with four attitude covariates in both equations, and repeated it without attitudes. Support depended on indirect effects alone. The indirect effects and their difference received percentile 95% intervals from 10,000 usable participant bootstrap samples; individual paths had robust Wald intervals.

4. Relative relevance for H1 and H4b–H4d

I used E4a's existing key to replace the ten-item mean with mean relevance of items consistent with self-managed abortion (SMA; items 1, 6, and 7) minus that of the remaining items. Pooling all ten items could conceal a shift toward outcome-fitting evidence. E4a examined that contrast at item level, without likelihood judgments. Using the SMA key left financial-crime sense-making untested (H1b and H4c). I changed only the relevance measure; other specifications and support criteria followed the registration. I read support from the primary sample and reported registered ten-item-mean results alongside each affected hypothesis.

I recognized this preregistration mistake after seeing the registered results, although it was knowable before collection. Choosing the relative score then reduced test severity and could change H1a–H1d and H4b–H4d decisions; the score more directly represented the predicted contrast.

Study 2 Deviations Record

Purpose

I compared the analyses with registration b53yg, its form, study materials, exploratory supplement, and two power-analysis scripts.

1. Comparisons added after registration and the procedure that tests them

What was posted: a directional hypothesis receives support if its 95% confidence interval excludes zero in the predicted direction, "with no correction for multiple comparisons" (supplement, "Preamble"). Confidence in the probable-cause ruling is among the judgments that "will be summarized descriptively and are not analyzed inferentially in Study 2" (supplement, "Additional within-model and descriptive reports").

After seeing the Study 02 results, I added 12 comparisons: all three pairwise differences among SMA, NCM, and no outcome information in a signed probable cause–confidence score, from a model with the H5d ANCOVA specification.

I signed the confidence rating by the ruling: positive for finding probable cause and negative for rejecting it. Thus equally confident opposite rulings receive opposite signs on the −100 to 100 score, rather than sharing a high 0–100 confidence value. Three outcome pairs, two covariate specifications (with or without the four attitudes), and two samples (N = 320 and registered sensitivity N = 212) yielded 12 comparisons. I regarded the registration's omission of these comparisons as an error because relating the probable-cause ruling to confidence was central to the study's purpose.

For each model, I tested the family of three comparisons—SMA–no information, NCM–no information, and SMA–NCM—with Fisher's protected least significant difference (LSD) procedure (Levin et al., 1994). I first used the same fitted model and covariance matrix to test whether the SMA–no-information and NCM–no-information differences were jointly zero, with a Wald $F(2, \text{residual } df)$ test. I regarded a pairwise difference as significant only if both its own p value and the omnibus p value were below .05. For reporting, I used the larger of these values as the protected p value. I decided on this procedure after seeing the results.

I also checked each model's family of three comparisons with single-step Tukey-adjusted p values from the same fit and covariance. Of the 12 added comparisons, six were significant

under LSD and three had Tukey-adjusted *p* values below .05. The discordant comparisons were:

- Adjusted primary sample, SMA–no information: *p* = .038 (LSD), .078 (Tukey).
- Adjusted primary sample, SMA–NCM: .038, .057.
- Unadjusted sensitivity sample, SMA–NCM: *p* = .024 (LSD), .062 (Tukey).

I reported the added comparisons as post hoc tests with low severity because I chose the procedure after seeing its results. Registered analyses and support decisions were unchanged (supplement, “Exploratory analyses”).

2. Relative relevance as the mediator of H2a–H2d

For H2a–H2d, I replaced pooled relevance with a relative score in the registered observed-score model. Within each record, I subtracted mean relevance of facts fitting natural miscarriage (NCM) from mean relevance of facts fitting self-managed abortion (SMA), excluding facts fitting neither.

I chose this mediator after seeing the Study 02 results and classified the facts after seeing E1b. Both choices reduced test severity. I retained the other model specifications and support criteria, used the adjusted primary analysis for support decisions, and reported the registered latent-factor results alongside it.
